IP

bintec User's Guide - R Series
Version 0.9

Purpose

This document is part of the user's guide to the installation and configuration of bintec gateways running software release 7.2.4 or later. For up-to-the-minute information and instructions concerning the latest software release, you should always read our **Release Notes**, especially when carrying out a software update to a later release level. The latest **Release Notes** can be found at www.funkwerk-ec.com.

Liability

While every effort has been made to ensure the accuracy of all information in this manual, Funkwerk Enterprise Communications GmbH cannot assume liability to any party for any loss or damage caused by errors or omissions or by statements of any kind in this document and is only liable within the scope of its terms of sale and delivery.

The information in this manual is subject to change without notice. Additional information, changes and **Release Notes** for bintec gateways can be found at www.funkwerk-ec.com.

As multiprotocol gateways, bintec gateways set up WAN connections in accordance with the system configuration. To prevent unintentional charges accumulating, the operation of the product should be carefully monitored. Funkwerk Enterprise Communications GmbH accepts no liability for loss of data, unintentional connection costs and damages resulting from unsupervised operation of the product.

Trademarks

bintec and the bintec logo are registered trademarks of Funkwerk Enterprise Communications GmbH.

Other product names and trademarks mentioned are usually the property of the respective companies and manufacturers.

Copyright

Guidelines and standards

bintec gateways comply with the following guidelines and standards:

R&TTE Directive 1999/5/EG

CE marking for all EU countries and Switzerland

You will find detailed information in the Declarations of Conformity at www.funkwerk-ec.com.

How to reach Funkwerk Enterprise Communications GmbH

Funkwerk Enterprise Communications GmbH Suedwestpark 94 D-90449 Nuremberg Germany Telephone: +49 180 300 9191 0 Fax: +49 180 300 9193 0 Internet: www.funkwerk-ec.com	Bintec France 6/8 Avenue de la Grande Lande F-33174 Gradignan France Telephone: +33 5 57 35 63 00 Fax: +33 5 56 89 14 05 Internet: www.bintec.fr

1 IP Menu

The *IP* menu is described below.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP]: IP Configuration                                          MyGateway

         Routing
         Static Settings
         Network Address Translation
         UPnP
         Bandwidth Management (TDRC / Load Balancing / BOD)
         IP address pool WAN (PPP)
         IP address pool LAN (DHCP)
         SNMP
         Remote Authentication (RADIUS/TACACS+)
         DNS
         DynDNS
         Routing Protocols

         EXIT
```

The ***IP*** main menu provides access to the submenus:

- ***ROUTING***
- ***STATIC SETTINGS***
- ***NETWORK ADDRESS TRANSLATION***
- ***UPNP***
- ***BANDWIDTH MANAGEMENT (TDRC / LOAD BALANCING / BOD)***
- ***IP ADDRESS POOL WAN (PPP)***
- ***IP ADDRESS POOL LAN (DHCP)***
- ***SNMP***
- ***REMOTE AUTHENTICATION (RADIUS/TACACS+)***
- ***DNS***
- ***DYNDNS***
- ***ROUTING PROTOCOLS***

1 IP Menu

2 Routing Submenu

The *ROUTING* submenu is described below.

The ***IP*** ➜ ***ROUTING*** menu contains a list of all your gateway's IP routes.

FLAGS show the current status (*Up*, *Dormant*, *Blocked*) and the type of route (*Gateway Route*, *Interface Route*, *Subnet Route*, *Host Route*, *Extended Route*). The protocol with which your gateway has "learned" the routing entry is shown under ***PRO***, e.g. ***LOC*** = local, i.e. configured manually.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][ROUTING]: IP Routing                                       MyGateway

The flags are: U (Up), D (Dormant), B (Blocked),
               G (Gateway Route),   I (Interface Route),
               S (Subnet Route),    H (Host Route),
                                    E (Extended Route)

Destination     Gateway         Mask           Flags Met Interface Pro
192.168.0.0   192.168.0.254 255.255.255.0 US   0  en0-1    loc
192.168.1.0   192.168.100.2 255.255.255.0 DG   1  branch   loc
192.168.100.2 192.268.100.1 255.255.255.0 DH   1  branch   loc

     ADD                ADDEXT              DELETE              EXIT
```

You can add a new route with ***ADD*** or edit an existing entry by tagging it with the cursor and pressing ***ENTER***. The following menu opens:

```
R232bw Setup Tool                 Funkwerk Enterprise Communication GmbH
[IP][ROUTING][ADD]                                              MyGateway

   Route Type                     Host route
   Network                        LAN

   Destination IP Address

   Gateway IP Address
   Metric                         1

                    SAVE                                  CANCEL
```

The ***ROUTING*** ➜ ***ADD/EDIT*** menu consists of the following fields:

Field	Description
Route Type	Type of route. Possible values: ■ *Host route* (default value): Route to a single host. ■ *Network route*: Route to a network. ■ *Default route*: This route is valid for all IP addresses and is only used if no other suitable route is available.
Network	Defines the type of connection (LAN, WAN). For possible values see table "NETWORK selection options," on page 7.
Destination IP Address	Only if ***ROUTE TYPE*** *Host route* or *Network route*. IP address of the destination host or network.
Netmask	Only if ***ROUTE TYPE*** = *Network route*. Netmask for ***DESTINATION IP ADDRESS***. If no entry is made, the gateway uses a default netmask.

Field	Description
Partner / Interface	WAN partner or interface (only if ***NETWORK*** = *WAN without transit network*).
Gateway IP Address	Only for ***NETWORK*** **=** *LAN* or *WAN with transit network*. IP address of the host to which your gateway should forward the IP packets.
Metric	The lower the value, the higher the priority of the route (possible values *0...15*; default value is *0*).

Table 2-1: ***ROUTING*** ➜ ***ADD/EDIT*** menu fields

NETWORK offers the following selection options:

Description	Meaning
LAN	Route to a destination host or network that can be reached via your gateway's LAN connection.
WAN without transit network	Route to a destination host or network that can be reached via a WAN partner without including any transit network available.
WAN with transit network	Route to a destination host or network that can be reached via a WAN partner including any transit network available.
Refuse	Your gateway discards data packets using this route and sends a message to the sender saying the destination of the packet is unreachable.
Ignore	Your gateway discards data packets using this route without sending a message to the sender.

Table 2-2: ***NETWORK*** selection options

In addition to the normal routing table, the gateway can also make routing decisions based on an Extended Routing Table. Apart from the source and destina-

tion address, the gateway can also include the protocol, source and destination port, type of service (TOS) and the status of the gateway interface in the decision.

Note

Entries in the Extended Routing Table are treated preferentially compared with entries in the normal routing table.

The configuration is set up in the ***IP*** ➜ ***ROUTING*** ➜ ***ADDEXT*** menu.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][ROUTING][ADD]: IP Routing - Extended Route                MyGateway

 Route Type                    Host route
 Network                       LAN

 Destination IP Address

 Gateway IP Address
 Metric                        1
 Source Interface              don't verify
 Source IP Address
 Source Mask
 Type of Service (TOS)         00000000  TOS Mask  00000000
 Protocol                      don't verify

            SAVE                                  CANCEL
```

This menu shows the following fields in addition to the fields of the ***ROUTING*** ➜ ***ADD/EDIT*** menu:

Field	Description
Mode	Only for ***NETWORK*** = *WAN without transit network*. Defines when the interface selected under ***PARTNER / INTERFACE*** is to be used. For possible values see table "MODE selection options," on page 10.

Field	Description
Source Interface	Interface over which the data packets reach the gateway. Default value is *don't verify*.
Source IP Address	Address of the source host or network.
Source Mask	Netmask for ***SOURCE IP ADDRESS***.
Type of Service (TOS)	Possible values: 0..255 in binary format.
TOS Mask	Bit mask for ***TYPE OF SERVICE (TOS)***.
Protocol	Defines a protocol. Possible values: *don't verify*, *icmp*, *ggp, tcp*, *egp*, *pup*, *udp*, *hmp*, *xns*, *rdp*, *rsvp*, *gre*, *esp*, *ah*, *igrp*, *ospf*, *l2tp*. Default value is *don't verify*.
Source Port	Only if ***PROTOCOL*** = *tcp* or *udp*. Source port number or range of source port numbers (see table "Selection options of SOURCE PORT AND DESTINATION PORT," on page 10).
Destination Port	Only if ***PROTOCOL*** = *tcp* or *udp*. Destination port number or range of destination port numbers (see table "Selection options of SOURCE PORT AND DESTINATION PORT," on page 10).

Table 2-3: ***ROUTING*** ➜ ***ADDEXT*** menu fields

MODE offers the following selection options:

Description	Meaning
always (default value)	Always use the route.
dialup wait	Route can be used if the interface is "up". If the interface is "dormant", then dial and wait until the interface is "up".

Description	Meaning
dialup continue	Route can be used if the interface is "up". If the interface is "dormant", then select and use the alternative route (rerouting) until the interface is "up".
up only	Route can be used if the interface is "up".

Table 2-4: ***MODE*** selection options

SOURCE PORT and ***DESTINATION PORT*** offer the following selection options:

Description	Meaning
any (default value)	The route is valid for all ➤➤ **port** numbers.
specify	Enables the entry of a port number.
specify range	Enables the entry of a range of port numbers.
priv (0...1023)	Privileged port numbers: 0 ... 1023.
server (5000....32767)	Server port numbers: 5000 ... 32767.
clients 1 (1024....4999)	Client port numbers: 1024 ... 4999.
clients 2 (32768....65535)	Client port numbers: 32768 ... 65535.
unpriv (1024...65535)	Unprivileged port numbers: 1024 ... 65535.

Table 2-5: Selection options of ***SOURCE PORT AND DESTINATION PORT***

3 Static Settings Submenu

The *STATIC SETTINGS* submenu is described below.

```
R232bw Setup Tool               Funkwerk Enterprise Communication GmbH
[IP][STATIC]: IP Static Settings                              MyGateway

    Domain Name
    Primary Domain Name Server
    Secondary Domain Name Server
    Primary WINS
    Secondary WINS

    Remote CAPI Server TCP port     2662
    Remote TRACE Server TCP port    7000
    RIP UDP port                    520

    Primary BOOTP Relay Server
    Secondary BOOTP Relay Server

    Unique Source IP Address
    HTTP TCP port                   80

          SAVE                                  CANCEL
```

The ***IP*** ➜ ***STATIC SETTINGS*** menu is for configuring the general IP settings for your gateway.

The ***IP*** ➜ ***STATIC SETTINGS*** menu consists of the following fields:

Field	Description
Domain Name	Default Domain Name of Gateway.
Primary Domain Name Server	IP address of a global Domain Name Server (DNS).
Secondary Domain Name Server	IP address of an alternative global Domain Name Server.
Primary WINS	IP address of a global Windows Internet Name Server (=WINS) or NetBIOS Name Server (=NBNS).
Secondary WINS	IP address of an alternative global WINS or NBNS.

Field	Description
Remote CAPI Server TCP Port	TCP port number for ➤➤ **Remote CAPI** connections. The default value is *2662*. Deactivate with *0*.
Remote TRACE Server TCP Port	TCP port number for remote traces. The default value is *7000*. Deactivate with *0*.
RIP UDP Port	UDP port number for ➤➤ **RIP** (Routing Information Protocol). The default value is *520*. Deactivate with *0*.
Primary BOOTP Relay Server	Here you can enter the IP address of a server to which BootP or DHCP requests are forwarded.
Secondary BOOTP Relay Server	Here you can enter the IP address of an alternative BootP or DHCP server.
Unique Source IP Address	Here you can enter an IP address that is used by the gateway as source address for locally generated IP packets. This should only be configured in special cases.
HTTP TCP Port	Here you enter the TCP port for accessing the HTTP service of the gateway (HTML start page). The default value is *80*.

Table 3-1: ***STATIC SETTINGS*** menu fields

4 Network Address Translation Submenu

The *IP* ➜ *NETWORK ADDRESS TRANSLATION* menu is described below.

Network Address Translation (➤➤ **NAT**) is a feature of your gateway for defined conversion of source and destination addresses of IP packets (in ***SESSIONS REQUESTED FROM INSIDE*** and ***SESSIONS REQUESTED FROM OUTSIDE***). If NAT is activated, IP connections are still only allowed as standard in one direction, outgoing (forward) (= protective function). Exceptions to the rules can be configured (in ***SESSIONS REQUESTED FROM OUTSIDE***).

The ***IP*** ➜ ***NETWORK ADDRESS TRANSLATION*** menu shows a list of all interfaces of your gateway.

To edit an entry, tag the interface for which you wish to configure NAT with the cursor and press **Return**. The following menu opens:

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][NAT][EDIT]: NAT Configuration (Internet)                  MyGateway

 Network Address Translation          off
 Silent Deny                          no
 PPTP Passthrough                     no

 Enter configuration for sessions:    requested from OUTSIDE
                                      requested from INSIDE

                SAVE                              CANCEL
```

The ***NETWORK ADDRESS TRANSLATION*** ➜ ***EDIT*** menu consists of the following fields:

Field	Description
Network Address Translation	Defines the type of NAT for the selected interface. Possible values: ■ *off* (default value): Do not execute NAT. ■ *on*: Execute Forward NAT. ■ *reverse*: Execute Reverse NAT.
Silent Deny	Defines whether the sender of an IP packet denied by NAT is to be informed of the denial. Possible values: ■ *no* (default value): Sender is informed by a relevant ICMP message. ■ *yes*: The sender is not informed.
PPTP Passthrough	PPTP Passthrough allows setting up and operation of several simultaneous outgoing PPTP connections of hosts in the network even if NAT is activated. Possible values: *yes* or *no*. If ***PPTP PASSTHROUGH*** = *yes*, the gateway itself cannot be configured as a tunnel endpoint.

Table 4-1: ***NETWORK ADDRESS TRANSLATION*** menu fields

4.1 Requested from OUTSIDE/INSIDE Submenu

The *REQUESTED FROM OUTSIDE/INDSIDE* menu is described below.

For other NAT settings, the ***IP*** ➜ ***NETWORK ADDRESS TRANSLATION*** ➜ ***EDIT*** menu contains two submenus (the possible settings of the two menus differ only slightly):

- ***IP → NETWORK ADDRESS TRANSLATION → EDIT → REQUESTED FROM OUTSIDE***
  In this menu you can allow certain incoming IP connections.
- ***IP → NETWORK ADDRESS TRANSLATION → EDIT → REQUESTED FROM INSIDE***
  In this menu you can map the source IP addresses and ports for certain outgoing IP connections (= address mapping).

Both menus show a list of the address mappings already configured. The abbreviations used are explained above the list.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][NAT][EDIT][OUTSIDE][ADD]: NAT - sessions from            MyGateway
                               OUTSIDE (Internet)

Abbreviations:   r(remote) i(internal) e(external) a(address) p(port)

  Service      Conditions
  ------------------------------------------------------------
  http         ia 192.168.0.254/32, ep 80, ip 80

    ADD                 DELETE                          EXIT
```

Add an entry with ***ADD*** or edit an existing entry by tagging it with the cursor and pressing **Return**. The following menu opens:

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][NAT][EDIT][OUTSIDE][ADD]: NAT - sessions from            MyGateway
                              OUTSIDE (Internet)

  Service                      user defined
  Protocol                     icmp

  Remote Address
  Remote Mask

  External Address
  External Mask
  External Port                any

  Internal Address
  Internal Mask                255.255.255.255
  Internal Port                any

               SAVE                                  CANCEL
```

The ***REQUESTED FROM OUTSIDE/INSIDE ➜ ADD/EDIT*** menu consists of the following fields:

Field	Description
Service	***REQUESTED FROM OUTSIDE ➜ ADD/EDIT***: Service for which incoming connections are allowed. ***REQUESTED FROM INSIDE ➜ ADD/EDIT***: Service for which address mapping is defined for outgoing connections. Possible values: *ftp, telnet, smtp, domain/udp, domain/tcp, http, nntp, user defined* (for other services, default value)
Protocol	Only for ***SERVICE*** = *user defined*. Defines the protocol. Possible values: *icmp, tcp, udp, gre, esp, ah, l2tp,any*

Field	Description
Remote Address	Optional. IP address of a host or network at the remote end. Enable or address mapping applies only to packets of this host or network.
Remote Mask	Netmask for ***REMOTE ADDRESS***.
Remote Port Port...to Port	Only in ***REQUESTED FROM INSIDE*** ➜ ***ADD/EDIT*** menu. Only for ***SERVICE*** = *user defined*. Entry of destination port or port range for outgoing IP connections for which address mapping is to be used. Possible values: ■ *any* ■ *specify*: Enables the entry of a port number. ■ *specify range*: Enables the entry of a port number range .
External Address	External host or network IP address at the selected interface.
External Mask	Netmask for ***EXTERNAL ADDRESS***. If you use external and internal network IP addresses, the values for ***EXTERNAL MASK*** and ***INTERNAL MASK*** must be identical.

Field	Description
External Port Port...to Port	Only for ***SERVICE*** = *user defined*. ■ ***REQUESTED FROM OUTSIDE*** ➜ ***ADD/EDIT***: Only for ***SERVICE*** = *user defined*; original destination port of incoming IP connection. ■ ***REQUESTED FROM INSIDE*** ➜ ***ADD/EDIT:*** The newly set source port of the outgoing IP connection. Possible values: ■ *any* (default value): For ***REQUESTED FROM INSIDE*** ➜ ***ADD/EDIT***; this means no port mapping. ■ *specify*: Enables the entry of a port number. ■ *specify range* (only for ***REQUESTED FROM OUTSIDE*** ➜ ***ADD/EDIT***) Enables the entry of a port number range.
Internal Address	IP address of the internal host or network.
Internal Mask	Netmask for ***INTERNAL ADDRESS***. If you use external and internal network IP addresses, the values for ***EXTERNAL MASK*** and ***INTERNAL MASK*** must be identical.

Field	Description
Internal Port Port	■ ***REQUESTED FROM OUTSIDE →ADD/EDIT***: Newly set destination port of the incoming IP connection. ■ ***REQUESTED FROM INSIDE → ADD/EDIT:*** Original source port of the outgoing IP connection. Possible values: ■ *any* (default value): For ***REQUESTED FROM OUTSIDE → ADD/EDIT***; this means no port mapping. ■ *specify*: Enables the entry of a port number.

Table 4-2: ***REQUESTED FROM OUTSIDE/INSIDE*** menu fields

4 Network Address Translation Submenu

5 UPnP Submenu

The *IP* ➜ *UPnP* menu is described below.

Universal Plug and Play (UPnP) enables a client within your LAN to prompt a NAT enabled gateways to open ports and create port mappings that are required by current messenger services like real time video conferencing.

Configuring your gateway for UPnP is carried out using only a few new parameters in the menu ***IP*** ➜ ***UPnP***:

```
R232bw Setup Tool              Funkwerk Enterprise Communications GmbH
[IP][UPNP]: UPnP Configuration                                MyGateway

     UPnP status                          disabled

     TCP port number for UPnP             5678

          SAVE                             CANCEL
```

The menu contains the following fields:

Field	Description
UPnP status	Here you choose the which policy the gateway applies to UPnP requests from the LAN. Available values are: ■ *disabled* (default) - The gateway discards UPnP requests, ther are no changes to NAT. ■ *restricted* - The gateway opens ports and creates port mappings exclusively for the requesting host. ■ *enabled* - The gateway creates UPnP NAT settings for the entire LAN.

Field	Description
TCP port number for UPnP	Here you enter the port number on which the gateway listens for UPnP requests. Possible values are *1* to *65535*, default is *5678*.

Table 5-1: ***IP ➜ UPnP***

6 Bandwidth Management (TDRC / Load Balancing / BOD) Submenu

The *BANDWIDTH MANAGEMENT (TDRC / LOAD BALANCING/ BOD)* menu is described below.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][BW]: Bandwidth Management for IP                          MyGateway

        TCP Download Rate Control (TDRC)

        IP Load Balancing over Multiple Interfaces

        IP triggered Bandwidth on Demand (IP BOD)

        EXIT
```

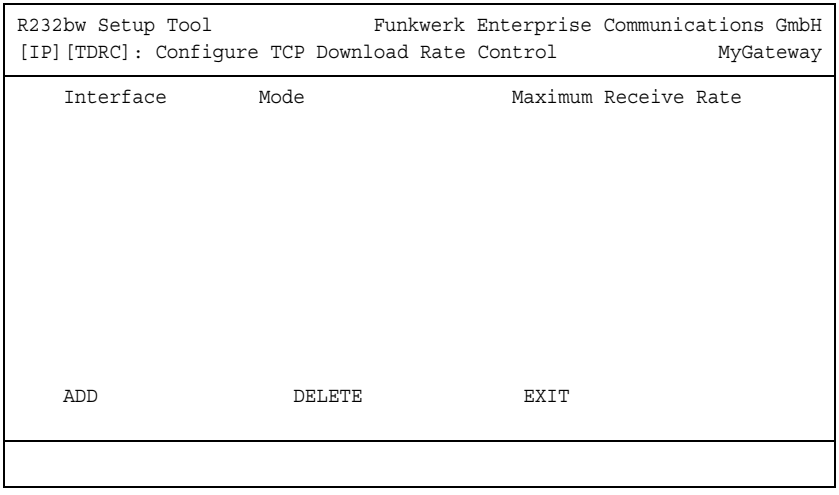
The ***BANDWIDTH MANAGEMENT (TDRC / LOAD BALANCING / BOD)*** menu provides access to the submenu:

- ***TCP DOWNLOAD RATE CONTROL (TDRC)***
- ***IP LOAD BALANCING OVER MULTIPLE INTERFACES***
- ***IP TRIGGERED BANDWIDTH ON DEMAND (IP BOD)***

6.1 TCP Download Rate Control (TDRC) Menu

The *TDRC* menu is decribed below.

The ***IP*** ➜ ***BANDWIDTH MANAGEMENT (TDRC / LOAD BALANCING / BOD)*** ➜ ***TCP DOWNLOAD RATE CONTROL (TDRC)*** menu displays a list of the interfaces, for which the TDRC-Mechanismus has already been configured.



An increasing number of network services requires that data is transferred not only as fast as possible, but also at constant transfer rates (e.g. VoIP). Your gateway offers a mechanism to obviate corresponding problems especially for ADSL connections.

Constant transfer rates for low latency data streams can basically be secured in two ways: On the one hand it is possible to reduce the download rate available for general usage so that a certain bandwidth is reserved for a High Priority QoS queue. On the other hand it is possible to use the available bandwidth as effectively as possible by prioritizing the upload of TCP ACK packets in the upstream of asynchronous ADSL connections. This avoids latency that would be created as a result of the comparatively small upload bandwidth of ADSL connections.

Both mechanisms are configured in the menu ***IP ➜ BANDWIDTH MANAGEMENT (TDRC / LOAD BALANCING / BOD) ➜ TCP DOWNLOAD RATE CONTROL (TDRC) ➜ ADD/EDIT.*** (The screenshot does not show the default values.)

```
R232bw Setup Tool              Funkwerk Enterprise Communications GmbH
[IP][TDRC][EDIT]: Configure TCP Download Rate Control        MyGateway

  Interface             50000   ethoa50-0

  Optimize Download Rate via TCP ACK prioritisation      no
  (recommended for ADSL)

  TDRC Mode      disabled

  Maximum TCP Download Rate (kbits/s)          1024

  Control all TCP Services                     no
  Select TCP Services >

         SAVE                                CANCEL
```

The menu contains the following fields:

Field	Description
Interface	Here you choose the interface the configuration is applied to.
Optimize Download Rate via TCP ACK prioritisation	Here you choose whether the download rate is to be optimized by prioritizing TCP ACK packets. If you choose *yes*, all of the following fields are no longer available. Available values are *yes* and *no*, default is *no*.

Field	Description
TDRC Mode	Only available for ***Optimize Download Rate via TCP ACK prioritisation*** = *no.* Here you choose the TDRC (TCP Download Rate Control) policy. Available values: ■ *static (fixed maximum rate for TCP download)* (default) - The download rate of TCP connections is statically restricted to the value specified by ***Maximum TCP Download Rate (kbits/s)***. ■ *dynamic (maximum rate less amount of high priority traffic)* - The download rate is restricted to a value dynamically determined. The value is computed from the value specified by ***Maximum TCP Download Rate (kbits/s)*** minus the bandwidth that is required by all QoS High Priority traffic over the current interface at the moment of adding or terminating a TCP session. This choice requires a QoS configuration for the respective interface. ■ *disabled* - The TCP download rate remains unrestricted.
Maximum TCP Download Rate (kbits/s)	Here you specify the maximum bandwidth for TCP connections over this interface. Available values are *1* to *100000*, default is *1024*.
Control all TCP Services	Here you choose if the download control configured is to be applied to all TCP connections. Available values are *yes* and *no*, default is *yes*.

Table 6-1: ***IP ➜ Bandwidth Management (TDRC / Load Balancing / BOD) ➜ TCP Download Rate Control (TDRC) ➜ ADD/EDIT***

If you choose *no* for ***CONTROL ALL TCP SERVICES***, ***SELECT TCP SERVICES*** allows access to the configuration of all services that TDRC is to be applied to (the screenshot shows the preconfigured services):

```
R232bw Setup Tool              Funkwerk Enterprise Communications GmbH
[IP][TDRC][SERVICES]: Configure TCP Services                  MyGateway

 TCP Port                                  Status

    80              HTTP                    builtin
    443             HTTPS                   builtin
    20              FTP Data                builtin
    110             POP3                    builtin
    143             IMAP2                   builtin

     ADD                DELETE              EXIT
```

ADD allows access to the configuration of further services:

```
R232bw Setup Tool              Funkwerk Enterprise Communications GmbH
[IP][TDRC][SERVICES][ADD]: Configure TCP Services             MyGateway

     TCP Service Port              1

     Status                        enabled

     Alias Name (Description)

            SAVE                                  CANCEL
```

The menu contains the following fields:

Field	Description
TCP Service Port	Here you enter the TCP port of the service you want to configure. Available values are *1* to *65535*, default is *1*.

Field	Description
Status	Here you choose if the service configured is to be actually controlled. Available values are *enabled* and *disabled*, default is *enabled*.
Alias Name (Description)	Here you enter a description for the service you have configured, the maximum length of the entry is 20 characters.

Table 6-2: ***IP ➜ BANDWIDTH MANAGEMENT (TDRC / LOAD BALANCING / BOD) ➜ TCP DOWNLOAD RATE CONTROL (TDRC) ➜ ADD/EDIT ➜ SELECT TCP SERVICES ➜ ADD***

6.2 IP Load Balancing over Multiple Interfaces Submenu

The *IP LOAD BALANCING OVER MULTIPLE INTERFACES* menu is described below.

The increasing amount of data traffic over the Internet necessitates the possibility of being able to send data over different interfaces to increase the total bandwidth available. IP load balancing enables the distribution of data traffic within a certain group of interfaces to be controlled.

The configuration is set in the ***IP ➜ BANDWIDTH MANAGEMENT (LOAD BALANCING/BOD) ➜ IP LOAD BALANCING OVER MULTIPLE INTERFACES*** menu.

The menu shows a list of the interface groups already configured for load balancing.

Access to the menu for configuring the groups is via ***ADD/EDIT***.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][IP LOAD BALANCING][ADD]                                     MyGateway

   Description
   Interface Group ID    0

   Distribution Policy   session round-robin
   Distribution Mode     always (use operational up and
                         dormant interfaces)
   Distribution Ratio    equal for all interfaces of the
                         group

   Interface 1                                 none

   Interface 2                                 none

   Interface 3                                 none

                 SAVE              CANCEL
```

The menu contains the following fields:

Field	Description
Description	Here you enter the desired description of the interface group.
Interface Group ID	The ID of the interface group. This is assigned by the system automatically, but can also be edited. It is used only for internal assignment of the group. The default value is *0*.
Distribution Policy	Here you select in what way the data traffic is distributed to the interfaces configured for the group. Possible values: see “DISTRIBUTION POLICY selection options” on page 32

Field	Description
Distribution Mode	Here you select the state the interfaces in the group may have if they are to be included in load balancing. Possible settings: ■ *always (use operational up and dormant interfaces)*: Interfaces that are either up or dormant are included (default value). ■ *up-only (operational up interfaces only):* Only interfaces that are up are included.
Distribution Ratio	Not for ***DISTRIBUTION POLICY*** = *service/source-based routing*. Here you select whether the percentage share of data traffic is to be the same for all interfaces of the group or configured individually for each interface. Possible settings: ■ *equal for all interfaces of the group* (default value): All interfaces are automatically assigned the same share. ■ *individual for all interfaces of the group*: Each interface can be assigned a share individually.
Interface 1 - 3	Here you select the interfaces that are to belong to the group from the available interfaces.

Field	Description
Distribution Fraction (in percent)	Not for ***DISTRIBUTION POLICY*** = *service/source-based routing*. Appears only for ***INTERFACE 1 - 3*** if an interface has been selected. Here you enter the percentage of the data traffic to be assigned to an interface. The meaning differs according to the ***DISTRIBUTION POLICY*** used: ■ based on the number of sessions to be distributed for *session round-robin*. ■ based on the data rate for *bandwidth load-/upload-/download-dependent*.

Table 6-3: ***IP LOAD BALANCING OVER MULTIPLE INTERFACES*** menu fields

DISTRIBUTION POLICY offers the following selection options:

Field	Description
session round-robin	A newly added session is assigned to one of the group interfaces according to the percentage assignment of sessions to the interfaces. The number of sessions is decisive.
bandwidth load-dependent	A newly added session is assigned to one of the group interfaces according to the share of the total data rate handled by the interfaces. Decisive is the current data rate based on the data traffic in both the send and receive direction.
bandwidth download-dependent	A newly added session is assigned to one of the group interfaces according to the share of the total data rate handled by the interfaces. Decisive is the current data rate based on the data traffic in the receive direction only.

Field	Description
bandwidth upload-dependent	A newly added session is assigned to one of the group interfaces according to the share of the total data rate handled by the interfaces. Decisive is the current data rate based on the data traffic in the send direction only.
service/source-based routing	A newly added session is assigned to one of the group interfaces according to the configuration of the static routing in the ***IP Load Balancing over Multiple Interfaces*** ➜ ***ADD/EDIT*** ➜ ***IP Routing List*** menu. This menu is only accessible if you have selected *service/source-based routing*. see “IP Routing List Submenu” on page 32

Table 6-4: ***Distribution Policy*** selection options

6.2.1 IP Routing List Submenu

The *IP Routing List* menu only appears if an interface has been selected in *Distribution Policy* *service/source-based routing* and *Interface 1 - 3*.

The ***IP Load Balancing over Multiple Interfaces*** ➜ ***ADD/EDIT*** ➜ ***IP Routing List*** menu contains a list of all configured routing entries. The configuration is set in ***IP Routing List*** ➜ ***ADD/EDIT***.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][ROUTING][ADD]: Configure Service/Source-Based Routing   MyGateway

  Interface                      Internet1

  Type                           Host route
  Network                        WAN without transit network

  Destination IP Address

  Gateway IP Address

  Source IP Address
  Source Mask

  Protocol                       tcp
  Service                        unlisted service     Port  -1

              SAVE                            CANCEL
```

The menu contains the following fields:

Field	Description
Interface	Shows the interface to be edited. This field cannot be changed.
Type	Type of route. Possible values: ■ *Host route*: Route to a single host ■ *Network route* (default value): Route to a network ■ *Default route*: The route is valid for all IP addresses and is only used if no other suitable route is available
Network	Defines the type of connection (LAN, WAN). For possible values see table “NETWORK selection options,” on page 35.
Destination IP Address	Only if ***ROUTE TYPE*** *Host route* or *Network route*. IP address of the destination host or network.

Field	Description
Destination Mask	Only if ***ROUTE TYPE*** = *Network route* Netmask for Destination IP Address. If no entry is made, the gateway uses a default netmask.
Gateway IP Address	Only for ***NETWORK*** *LAN* or *WAN with transit network*. IP address of the host to which your gateway should forward the IP packets.
Source IP Address	IP address of the source host or network.
Source Mask	Netmask for ***SOURCE IP ADDRESS***.
Protocol	Defines a protocol. Possible values: *tcp*, *egp*, *pup*, *udp*, *hmp*, *xns*, *rdp*, *rsvp*, *gre*, *esp*, *ah*, *igrp*, *ospf*, *l2tp*, *don't verify*, *icmp*, *ggp*. The default value is *don't verify*.
Service	Here you select a predefined service for whose data traffic the entry is to apply. The value *unlisted service* is shown when accessing the menu. This is only a bookmark. The data traffic is not filtered by this entry as long as the default value *-1* is left in the ***PORT*** field.
Port	Can only be edited if ***PROTOCOL*** = *tcp* or *udp* and ***SERVICE*** = *unlisted service*. Entry of destination port for ***PROTOCOL*** *tcp* or *udp*. Possible settings are values from *-1* to *65535*. The default value *-1* means the destination port can be any port.

Table 6-5: ***IP ROUTING LIST*** ➜ ***ADD/EDIT*** menu fields

NETWORK contains the following selection options (depending on type of interface):

Description	Meaning
LAN	Route to a destination host or network that can be reached via your gateway's LAN connection.
WAN without transit network	Route to a destination host or network that can be reached via a WAN partner without including any transit network available.
WAN with transit network	Route to a destination host or network that can be reached via a WAN partner including any transit network available.

Table 6-6: ***NETWORK*** selection options

6.3 IP triggered Bandwidth on Demand (IP BOD) Submenu

The *IP TRIGGERED BANDWIDTH ON DEMAND (IP BOD)* menu is described below.

```
R232bw Setup Tool               Funkwerk Enterprise Communication GmbH
[IP][BOD]: Bandwidth on Demand for IP                          MyGateway

        Filter
        Rules for BOD
        Configure Interfaces for BOD

        EXIT
```

Application-controlled bandwidth management is configured via filters, filter rules and interface assignment.

Filter Filters define which IP packets (and thus applications) are to influence the available bandwidth.

Rule Rules define whether other ISDN B-channels are to be added to an existing connection to transfer the IP packets covered by the filters.

Chain Several rules can be interlinked to form a defined rule chain.

Interface You can also assign a rule chain individually to each interface.

Configuration is made in the following submenus:

- ***FILTER***
- ***RULES FOR BOD***
- ***CONFIGURE INTERFACES FOR BOD***

6.3.1 Filter Submenu

The *FILTER* menu is described below.

This shows a list of all configured filters (including the filters from ***IP*** ➜ ***ACCESS LISTS*** and ***QOS***.

The filters are configured in ***IP*** ➜ ***BANDWIDTH MANAGEMENT (LOAD BALANCING / BOD)*** ➜ ***IP TRIGGERED BANDWIDTH ON DEMAND (IP BOD)*** ➜ ***FILTER*** ➜ ***ADD/EDIT.***

```
R232bw Setup Tool                 Funkwerk Enterprise Communication GmbH
[IP][BOD][FILTER][EDIT]                                          MyGateway

  Description
  Index

  Protocol  any

  Source Address
  Source Mask

  Destination Address
  Destination Mask

  Type of Service (TOS)   00000000              TOS Mask  00000000

                    SAVE                                    CANCEL
```

The ***FILTER*** ➜ ***ADD/EDIT*** menu contains the following fields:

Field	Description
Description	Designation of the filter. Note that only the first 10 or 15 characters are visible in other menus.
Index	Cannot be changed here. The gateway assigns a number automatically to new filters defined here.
Protocol	Defines a protocol. Possible values: *any, icmp, ggp, ip, tcp, egp, igp, pup, chaos, udp, hmp, xns_idp, rdp, rsvp, gre, esp, ah, tlsp, skip, kryptolan, iso-ip, igrp, ospf, ipip, ipx-in-ip, vrrp, l2tp*. The default value is *any* and matches any protocol.

Field	Description
Type	Only if ***Protocol*** = *icmp*. Possible values: *any, echo reply, destination unreachable, source quench, redirect, echo, time exceeded, param problem, timestamp, timestamp reply, address mask, address mask reply*. The default value is *any*. See RFC 792.
Connection State	If ***Protocol*** = *tcp*, you can define a filter based on the state of the TCP connection. Possible values: ■ *established*: All TCP packets that would not open any new TCP connection on routing over the gateway match the filter. ■ *any* (default value): All TCP packets match the filter.
Source Address	Defines the source IP address of the data packets.
Source Mask	Netmask for ***Source Address***.
Source Port	Only for ***Protocol*** = *tcp/udp-port*. Source port number or range of source port numbers. Possible values: see “Source Port and Destination Port selection options” on page 39 The default value is *any*.
Specify Port ..to Port	If ***Source Port*** or ***Destination Port*** = *specify* or *specify range* Port numbers or range of port numbers.
Destination Address	Defines the destination IP address of the data packets.

Field	Description
Destination Mask	Netmask for ***DESTINATION ADDRESS***.
Destination Port	Only for ***PROTOCOL*** = *tcp/udp-port*. Destination port number or range of destination port numbers that matches the filter. Possible values: see "SOURCE PORT and DESTINATION PORT selection options" on page 39. The default value is *any*.
Type of Service (TOS)	Identifies the priority of the IP packet, cf. RFC 1349 and RFC 1812 (shown in binary format).
TOS Mask	Bitmask for Type of Service (shown in binary format).

Table 6-7: ***FILTER*** menu fields

SOURCE PORT and ***DESTINATION PORT*** contain the following selection options:

Field	Description
any (default value)	The route is valid for all ➤➤ **port** numbers.
specify	Enables the entry of a port number.
specify range	Enables the entry of a range of port numbers.
priv (0...1023)	Privileged port numbers: 0 ... 1023.
server (5000....32767)	Server port numbers: 5000 ... 32767.
clients 1 (1024....4999)	Client port numbers: 1024 ... 4999.
clients 2 (32768....65535)	Client port numbers: 32768 ... 65535.
unpriv (1024...65535)	Unprivileged port numbers: 1024 ... 65535.

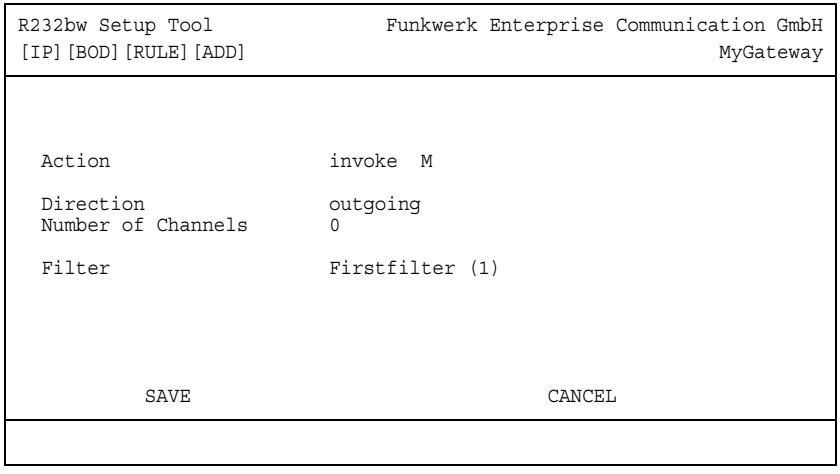
Table 6-8: ***SOURCE PORT*** and ***DESTINATION PORT*** selection options

6.3.2 Submenu Rules for BOD

The *RULES FOR BOD* menu is described below.

All the configured rules are listed in ***IP*** ➜ ***BANDWIDTH MANAGEMENT (LOAD BALANCING / BOD)*** ➜ ***IP TRIGGERED BANDWIDTH ON DEMAND (IP BOD)*** ➜ ***RULES FOR BOD***.

Configuration is carried out in the ***ADD/EDIT*** menu.



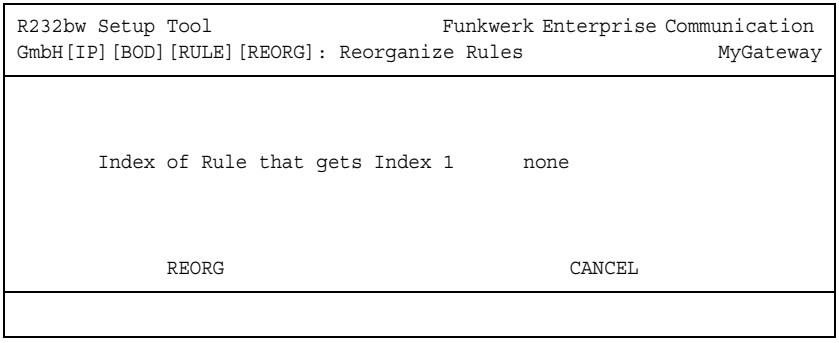
The menu consists of the following fields:

Field	Description
Index	Appears only for ***EDIT***. Cannot be changed. Shows the ***INDEX*** of existing rules. The gateway assigns a number to newly defined rules automatically.
Insert behind Rule	Appears only for ***ADD*** and if at least one rule exists. Defines the existing rule behind which the new rule is inserted. You can start a new independent chain with *none*.

Field	Description
Action	Defines the action to be taken for a filtered data packet. ■ *invoke M* (default value): B-channels are added if ***FILTER*** and ***DIRECTION*** match. ■ *invoke !M*: B-channels are added if ***FILTER*** or ***DIRECTION*** do not match. ■ *deny M*: B-channels are not added if ***FILTER*** and ***DIRECTION*** match. ■ *deny !M*: B-channels are not added if ***FILTER*** or ***DIRECTION*** do not match. ■ *ignore*: Use next rule.
Direction	Direction of data packets. Possible values: ■ *outgoing* (default value): outgoing data packets ■ *incoming*: incoming data packets ■ *both*: incoming and outgoing data packets.
Number of Channels	Number of B-channels that are to be added. The default value is *0*.
Filter	Filter used.
Next Rule	Appears only if an existing rule is edited. Defines the next rule to be used.

Table 6-9: ***RULES FOR BOD*** menu fields

You can reorganize the indexing of the rules in the ***IP*** ➜ ***BANDWIDTH MANAGEMENT (LOAD BALANCING / BOD)*** ➜ ***IP TRIGGERED BANDWIDTH ON DEMAND (IP BOD)*** ➜ ***RULES FOR BOD*** ➜ ***REORG*** menu, but the sequence of the configured rules is retained. The rule that is to receive rule ***INDEX 1*** is defined in the ***INDEX OF RULE THAT GETS INDEX 1*** field.



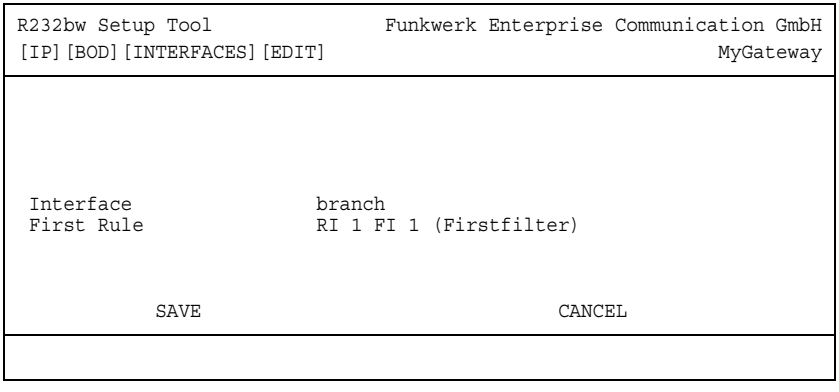
The rule chain that starts with rule ***INDEX** 1* is always applied as standard to the interface of the gateway (e.g. WAN partner).

6.3.3 Configure Interfaces for BOD Submenu

The *CONFIGURE INTERFACES FOR BOD* menu is described below.

All the WAN partner interfaces are listed in the ***IP*** ➜ ***BANDWIDTH MANAGEMENT (LOAD BALANCING / BOD)*** ➜ ***IP TRIGGERED BANDWIDTH ON DEMAND (IP BOD)*** ➜ ***RULES FOR BOD*** menu.

Assign the selected interfaces to the start of a rule chain in ***CONFIGURE INTERFACES FOR BOD*** ➜ ***EDIT***.



The menu consists of the following fields:

Field	Description
Interface	Name of interface that has been selected. This field cannot be edited.
First Rule	Defines the start of the rule chain to be applied to data packets received over ***INTERFACE***. If you enter *none* (default value), you specify that no filters are used for ***INTERFACE***.

Table 6-10: ***CONFIGURE INTERFACES FOR BOD → EDIT*** menu fields

7 IP Address Pool WAN (PPP) Sub-menu

The *IP ADDRESS POOL WAN (PPP)* menu is described below.

The ***IP*** ➜ ***IP ADDRESS POOL WAN (PPP)*** menu is for setting up a pool of IP addresses that your gateway as dynamic IP address server can assign to WAN partners to enable them to dial in.

All the configured IP address pools are listed here. The configuration is set up in the ***IP ADDRESS POOL WAN (PPP)*** ➜ ***ADD/EDIT*** menu.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][DYNAMIC][EDIT]                                              MyGateway

 Pool ID                                    0
 IP Address                                 192.168.0.11
 Number of Consecutive Addresses            2

           SAVE                                      CANCEL
```

The menu contains the following fields:

Field	Description
Pool ID	Unique number for identifying an IP address pool.
IP Address	First IP address in the range.
Number of Consecutive Addresses	Number of IP addresses in the range, including the first IP address. The default value is *1*.

Table 7-1: ***IP ADDRESS POOL WAN (PPP)*** menu fields

7 IP Address Pool WAN (PPP) Submenu

8 IP Address Pool LAN (DHCP) Sub-menu

The *IP ADDRESS POOL LAN (DHCP)* menu is described below.

IP* ➜ *IP ADDRESS POOL LAN (DHCP) is used for configuring the gateway as ➤➤ **DHCP** server (Dynamic Host Configuration Protocol).

All the configured interfaces and relevant IP address pools are listed here. The configuration is set up in the ***IP ADDRESS POOL LAN (DHCP)*** ➜ ***ADD/EDIT*** menu.

```
R232bw Setup Tool               Funkwerk Enterprise Communication GmbH
[IP][DHCP][ADD]: Define Range of IP Addresses                 MyGateway

  Interface                                 en0-1
  Type                                      Any
  IP Address
  Number of Consecutive Addresses           1
  Lease Time (Minutes)                      120
  MAC Address
  Alive Test Period (seconds, 0=disabled)   0

  Gateway
  NetBT Node Type                           not specified

        SAVE                                 CANCEL
```

The menu contains the following fields:

Field	Description
Interface	Interface to which the address pool is assigned. When a DHCP request is received over ***INTERFACE***, one of the addresses from the address pool is assigned.
IP Address	First IP address in the address pool.

Field	Description
Number of Consecutive Addresses	Total number of IP addresses in the address pool, including the first IP address (***IP ADDRESS***). The default value is *1*.
Lease Time (Minutes)	Defines the length of time an address from the pool is assigned to a host. After the ***LEASE TIME (MINUTES)*** expires, the address can be reassigned. The default value is *1*20.
MAC Address	Only for ***NUMBER OF CONSECUTIVE ADDRESSES*** = *1* ***IP ADDRESS*** is only assigned to the device with ***MAC ADDRESS***.
Alive Test Period (seconds, 0=disabled)	Specifies a period (in seconds) for checking that the clients, which got an IP address from ***IP ADDRESS POOL LAN (DHCP)***, are still alive. If not, the IP addressed can be assigned to further requesting clients. Possible values are *0*..*65535*. Default value is *0*. If set to 0, no alive check is performed.
Gateway	Defines which IP address is transferred to the DHCP client as gateway. If no IP address is entered here, the IP address defined in ***INTERFACE*** is transferred.

Field	Description
NetBT Node Type	Defines how and in which order the host carries out resolution of NetBIOS names to IP addresses. Possible values: ■ *not specified* (default value) ■ *Broadcast Node* ■ *Point-to-Point Node* ■ *Mixed Node* ■ *Hybrid Node*

Table 8-1: ***IP ADDRESS POOL LAN (DHCP)*** menu fields

8 IP Address Pool LAN (DHCP) Submenu

9 SNMP Submenu

The *SNMP* menu is described below.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][SNMP]: SNMP Configuration                                  MyGateway

     SNMP versions               v1|v2c|v3

     SNMP listen UDP port        161
     SNMP trap UDP port          162
     SNMP trap broadcasting      off
     SNMP trap community         snmp-Trap

        SAVE                                    CANCEL
```

IP ➜ ***SNMP*** is for changing the basic ➤➤ **SNMP** settings.

The ***SNMP*** menu contains the following fields:

Field	Description
SNMP versions	This parameter determines which SNMP version the gateway allows for external SNMP connections. Available values are: ■ *v1|v2c|v3* (default) - The gateway accepts SNMP V. 1, 2 and 3. ■ *off* - The gateway accepts no external SNMP commands, i.e. SNMP access is possible exclusively from the console of the gateway (e.g. via SSH or the serial interface). ■ *v1|v2c* - The gateway accepts SNMP V. 1 and SNMP V. 2. Your gateway supports SNMP V. 2c which supports 64 bit counters and access control through SNMP communities. ■ *v3* - The gateway accepty only SNMP V. 3, supporting "real" user management and access control through access levels. You can find further information on all SNMP versions in the corresponding RFCs and Drafts: ■ SNMP V. 1: RFC 1157 ■ SNMP V. 2c: RFC 1901 – 1908 ■ SNMP V. 3: RFC 3410 – 3418.
SNMP listen UDP port	Here you enter the number of the udp port on which the gateway accepts SNMP requests. The default value is *161*. *0* deactivates the feature.

Field	Description
SNMP trap UDP port	Here you enter the number of the udp port to which the gateway sends SNMP traps. The default value is *162*. *0* deactivates the feature.
SNMP trap broadcasting	For activating SNMP trap broadcasting. The gateway then sends SNMP traps to the broadcast address of the LAN. Possible values are *on* and *off* (default value).
SNMP trap community	Here you can enter an SNMP ID. This must be sent by the SNMP Manager with every SNMP request so that this is accepted by your gateway. The default value is *snmp-Trap*.

Table 9-1: ***SNMP*** menu fields

9 SNMP Submenu

10 Remote Authentication (RADIUS/TACACS+) Submenu

The *REMOTE AUTHENTICATION (RADIUS/TACACS+)* menu is described below.

The ***IP*** ➜ ***REMOTE AUTHENTICATION (RADIUS/TACACS+)*** menu offers access to the following submenus:

- ***RADIUS AUTHENTICATION AND ACCOUNTING***
- ***TACACS+ AUTHENTICATION AND AUTHORIZATION***

10.1 RADIUS Authentication and Accounting Submenu

The *RADIUS SERVER* menu is described below.

Client / Server

RADIUS (Remote Authentication Dial In User Service) is a service that enables authentication and configuration information to be exchanged between your gateway and a RADIUS server. The RADIUS server administrates a database with information about user authentication and configuration and for statistical recording of connection data.

RADIUS can be used for:

- authentication
- accounting
- exchanging configuration data.

For an incoming connection, the bintec gateway sends a request with user name and password to the RADIUS server, which then searches its database. If the user is found and can be authenticated, the RADIUS server sends corresponding confirmation to the gateway. This confirmation also contains parameters (called RADIUS attributes), which the gateway uses as WAN connection parameters.

If the RADIUS server is used for accounting, the gateway sends an accounting message at the start of the connection and a message at the end of the connection. These start and end messages also contain statistical information about the connection (IP address, user name, throughput, costs).

RADIUS packets

The following types of packets are sent between the RADIUS server and bintec gateway (client):

Type	Purpose
ACCESS_REQUEST	Client –> Server If an access request is received by the gateway, a request is sent to the RADIUS server if no corresponding WAN partner has been found in the gateway.
ACCESS_ACCEPT	Server –> Client If the RADIUS server has authenticated the information contained in the ACCESS_REQUEST, it sends an ACCESS_ACCEPT to the gateway together with the parameters used for setting up the connection.
ACCESS_REJECT	Server –> Client If the information contained in the ACCESS_REQUEST does not correspond to the information in the user database of the RADIUS server, it sends an ACCESS_REJECT to reject the connection.
ACCOUNTING_START	Client -> Server If a RADIUS server is used for accounting, the gateway sends an accounting message to the RADIUS server at the start of each connection.
ACCOUNTING_STOP	Client -> Server If a RADIUS server is used for accounting, the gateway sends an accounting message to the RADIUS server at the end of each connection.

All the RADIUS servers currently configured are listed in the ***IP*** ➜ ***RADIUS SERVER*** menu.

The configuration is set up in ***IP*** ➜ ***RADIUS SERVER*** ➜ ***ADD/EDIT***.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][RADIUS][ADD]                                              MyGateway

          SAVE                                  CANCEL
```

The menu contains the following fields:

Field	Description
Protocol	Defines whether the RADIUS server is used for authentication purposes or accounting. Possible values: ■ *authentication* (default value) - The RADIUS server is used for controlling access to a network. ■ *accounting* - The RADIUS server is used for recording statistical connection data. ■ *shell login* - The RADIUS server is used for controlling access to the SNMP shell of the gateway. ■ *IPSec* - The RADIUS server is used for sending configuration data for IPSec peers to the gateway. ■ *802.1x* - The RADIUS server is used for controlling access to a WLAN.
IP Address	The IP address of the RADIUS server.
Password	This is the common password used for communication between the RADIUS server and gateway.
Priority	Priority of the RADIUS server. If a number of RADIUS server entries exist, the server with the highest priority is used first. If this server does not answer, the server with the next lower priority is used. Possible values: Whole numbers from *0* (highest priority) to *7* (lowest priority). The default value is *0*.

Field	Description
Policy	Defines how the bintec gateway responds if a negative answer is received to a request. Possible values: ■ *authoritative* (default value): A negative answer to a request is accepted. ■ *non authoritative*: A negative answer to a request is not accepted. A request is sent to the next RADIUS server until the gateway receives an answer from a server configured as authoritative.
Port	TCP port used for RADIUS data. RFC 2138 defines the default ports as 1812 for authentication (1645 in older RFCs) and 1813 for accounting (1645 in older RFCs). You can obtain the port to be used from the documentation for your RADIUS server. The default value is *1812*.
Timeout (ms)	Maximum waiting time in milliseconds between the ACCESS_REQUEST and answer. After timeout, the request is repeated according to ***RETRIES*** or the next configured RADIUS server is requested. Possible values: Whole numbers between *50* and *50000*. The default value is *1000* (1 second).

Field	Description
Retries	Number of repetitions if a request is not answered. If an answer is still not received after these retries, ***STATE*** is set to *inactive*. The gateway then tries to reach the server every 20 seconds; if the server answers, ***STATE*** is set to *active* again. Possible values: Whole numbers between *0* and *10*. The default value is *1*. To prevent ***STATE*** being set to *inactive*, set this value to *0*.
State	State of the RADIUS server. Possible values: ■ *active* (default value): Server answers requests. ■ *inactive*: Server does not answer (see ***RETRIES***). ■ *disabled*: Requests to a certain RADIUS server are temporarily deactivated.
Validate	Possible values: ■ *enabled* (default value): The gateway checks the identity of the RADIUS server using the MD5 checksum from ***PASSWORD***. This option should be activated for security purposes. ■ *disabled*: This option should only be selected in special cases.

Field	Description
Dialout	Here you can define whether the gateway receives requests from RADIUS server dialout routes. This enables temporary interfaces to be configured automatically and the gateway can initiate outgoing connections that are not configured permanently. Possible values: *enabled*, *disabled* (default value).
Alive Check (if inactive)	Here you can activate a check of the reachability of a RADIUS server in ***STATE*** *inactive*. ■ *enabled* (default value): An Alive Check is carried out regularly (every 20 seconds) by sending an ACCESS_REQUEST to the IP address of the RADIUS server. If the server is reachable, ***STATE*** is set to *active* again. If the RADIUS server is only reachable over a dialup connection, this can cause additional costs if the server is *inactive* for a long time. ■ *disabled*: Alive Check is not carried out.

Table 10-1: ***RADIUS SERVER*** menu fields

10.2 TACACS+ Authentication and Authorization Submenu

The *TACACS+ AUTHENTICATION AND AUTHORIZATION* menu is described below.

The ***IP*** ➜ ***REMOTE AUTHENTICATION (RADIUS/TACACS+)*** ➜ ***TACACS+ AUTHENTICATION AND AUTHORIZATION*** menu displays a list of all already configured TACACS+ servers.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][TACACS+]: Configure TACACS+ Server                          MyGateway

 IP Address       Priority     AdminStatus         OperStatus

192.168.0.100     0            up                  up

    ADD                 DELETE              EXIT
```

The TACACS+ protocol provides access control for gateways, network access servers and other network devices via one or more centralized servers. TACACS+ is an AAA protocol and thus provides authentication, authorization and accounting services (bintec gateways do not support TACACS+ Accounting at present).

Your bintec Gateway provides for the following TACACS+ funtions:

- Authentication for login shell
- Authentication for ppp connections
- Command authorization on the shell (e.g. telnet, setup. show)

TACACS+ uses TCP port 49 and sets up a secure and encrypted connection.

Configuration of a TACACS+ server is carried out in the ***IP*** ➜ ***REMOTE AUTHENTICATION (RADIUS/TACACS+)*** ➜ ***TACACS+ AUTHENTICATION AND AUTHORIZATION*** ➜ ***ADD/EDIT*** menu.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][TACACS+][ADD]                                              MyGateway

 Server's IP Address or Hostname

  Priority                                0            TCP Port  49
  TACACS+ Key (Secret)
  Policy                                  non authoritative
  Encryption (recommended)                enabled

  Timeout (seconds)                       3
  Block Time (seconds)                    60

  PPP Authentication                      disabled
  Login Authentication/Authorization      enabled
  TACACS+ Accounting                      disabled
  Administrative Status                   up
  TACACS+ Single-Connection               single request

          SAVE                                 CANCEL
```

It contains the following configuration options:

Field	Description
Server's IP Address or Hostname	Here you enter the IP address of the TACACS+ server that is to be queried for AAA (Authentication, Authorization, Accounting) request. (bintec gateways do not support TACACS+ Accounting at present.)
Priority	Here you assign a priority to the current TACACS+ server. The server with the lowest value is the first one used for a TACACS+ AAA request. If there is no response or the access was denied (only for ***POLICY*** = *non authoritative*), the entry with the next lowest priority will be used. Available values are *0* to *9*, the default value is *0*.

Field	Description
TCP Port	Here the default TCP port used for the TACACS+ protocol is set to *49*. The value cannot be changed.
TACACS+ Key (Secret)	Here you enter the password used to authenticate and (if applicable) encrypt the data exchange between the TACACS+ server and the Network Access Server (your gateway) (encryption only for ***ENCRYPTION (RECOMMENDED)*** = *enabled*). The maximum length of the entry is 32 characters.
Policy	Here you can choose the interpretation of the TACACS+ reply. Available values: ■ *authoritative*: A negative answer to a request is accepted, i.e. no further TACACS+ server sent a request. ■ *non authoritative* (default value): The TACACS+ servers are sent a request according to their ***PRIORITY***, until a positive answer or, if the request was sent to an authoritativen server, a negative answer is sent back. The gateway-internal user management is not disabled when using TACACS+ and is checked after all TACACS+ servers had been queried.

Field	Description
Encryption (recommended)	Here you can choose whether the data exchange between the TACACS+ server and the NAS is encrypted. Available values are *enabled* (default value) and *disabled*. ■ *enabled*: The TACACS+ packets are MD5 encrypted. ■ *disabled*: The packets and therefore all related information are sent unencrypted. Unencrypted transfer is not recommended for standard usage, but for debug purposes only.
Timeout (seconds)	Here you enter the time in seconds the NAS waits for a TACACS+ response. If no reply is received during waiting time, the next configured TACACS+ server is queried (only for ***POLICY*** = *non authoritative*) and the current server is set into a *blocked* state (siehe ***OPERSTATUS*** = *blocked* in ***IP*** ➜ ***REMOTE AUTHENTICATION (RADIUS/TACACS+)*** ➜ ***TACACS+ AUTHENTICATION AND AUTHORIZATION***). Available values are *1* to *60*, the default value is *3*.
Block Time (seconds)	Here you enter the amount of time in seconds for which the current server is set to a blocked state. After the Block Time has ended, the server is set to the state specified for the field ***ADMINISTRATIVE STATUS*** (see below). Available values are *0* to *3600*, the default value is *60*. A value of *0* means that the server is never set to a *blocked* state and thus no further servers are queried.

Field	Description
PPP Authentication	This function is not supported by **R Series**. It may be included in a later version of our system software. Here you define whether the current TACACS+ server is used for authentication of the ppp-dialin-clients.
Login Authentication/Authorization	Here you can choose whether to use the current TACACS+ server for login authentication to a gateway. Available choices are *enabled* (default value) and *disabled*.
TACACS+ Accounting	This function is not supported by **R Series**. It may be included in a later version of our system software. Here you define whether accounting for ppp connections and login is used.
Administrative Status	Here you can choose the status the server is to be put in. Possible values: ■ *up* (default value): The associated server is used for authentication, authorization and accounting according to the priority (see field ***PRIORITY***) and the current operational status (see ***OPERSTATUS*** in ***IP*** ➜ ***REMOTE AUTHENTICATION (RADIUS/TACACS+)*** ➜ ***TACACS+ AUTHENTICATION AND AUTHORIZATION***). ■ *down*: This entry will not be considered for TACACS+ AAA requests.

Field	Description
TACACS+ Single-Connection	■ *single request* (default value): Multiple TACACS+ sessions (subsequent TACACS+ requests) may be supported simultaneously over a single TCP connection. ■ *multiple requests*: Multiple sessions are not being multiplexed over a single TCP connection, a new connection will be opened for each TACACS+ session and closed at the end of that session.

Table 10-2: ***IP ➜ REMOTE AUTHENTICATION (RADIUS/TACACS+) ➜ TACACS+ AUTHENTICATION AND AUTHORIZATION ➜ ADD/EDIT***

11 DNS Submenu

The *DNS* menu is described below.

```
R232bw Setup Tool               Funkwerk Enterprise Communication GmbH
[IP][DNS]: IP Configuration - Nameservice                    MyGateway

   Positive Cache                   enabled
   Negative Cache                   enabled

   Overwrite Global Nameservers     yes
   Default Interface                none

   DHCP Assignment                  self
   IPCP Assignment                  global

   Static Hosts                     (0)
   Forwarded Domains                (0)
   Dynamic Cache                    (0 pos 0 neg)

   Advanced Settings...             Global Statistics...

              SAVE                            CANCEL
```

Name Resolution with the Gateway

The gateway offers the following options for name resolution:

- DNS proxy function, for forwarding DNS requests sent to the gateway to a suitable DNS server. This also includes specific forwarding of certain domains (Forwarded Domains).
- DNS cache, for saving the positive and negative results of DNS requests.
- Static entries (Static Hosts), for manually defining or preventing assignments of IP addresses to names.
- DNS monitoring, for providing an overview of DNS requests in the gateway.

Global Name Server

The IP addresses of global name servers that are asked if the gateway cannot answer requests itself or by forwarding entries are entered in ***IP*** ➜ ***STATIC SETTINGS***.

For local applications, the IP address of the gateway itself or the general loopback address (127.0.0.1) can be entered as global name server.

The gateway can also receive the addresses of the global name servers dynamically from WAN partners or if necessary transfer these to WAN partners:

Name Resolution Strategy in the Gateway

A DNS request is handled by the gateway as follows:

1. If possible, the request is answered directly from the static or dynamic cache with IP address or negative answer.
2. Otherwise, if a suitable forwarding entry exists, the relevant DNS server is asked, if necessary by setting up a WAN connection at extra cost. If the DNS server can resolve the name, the information is forwarded and a dynamic entry created in the cache.
3. Otherwise, if global name servers are entered, the Primary Domain Name Server then the Secondary Domain Name Server are asked. If the IP address of the gateway or the loopback address is entered for local applications, these are ignored here. If one of the DNS servers can resolve the name, the information is forwarded and a dynamic entry created in the cache.
4. Otherwise, if a WAN partner is selected as default interface, the associated DNS server is asked, if necessary by setting up a WAN connection at extra cost. If one of the DNS servers can resolve the name, the information is forwarded and a dynamic entry created in the cache.
5. Otherwise, if overwriting the addresses of the global name servers is allowed (***Overwrite Global Nameserver*** = *yes*), a connection is set up – if necessary at extra cost – to the first WAN partner configured to enable DNS server addresses to be requested from DNS servers, if this has not been attempted previously. If name server negotiation is successful, these are entered as global name servers and are therefore available for further requests.
6. Otherwise the initial request is answered with a server error.

If one of the DNS servers answers with “non-existent domain”, the initial request is immediately answered accordingly and a corresponding negative entry is made in the DNS cache of the gateway.

The configuration is set up in ***IP*** ➜ ***DNS***.

The menu contains the following fields:

Field	Description
Positive Cache	Activation of the positive dynamic cache. Possible values: ■ *enabled* (default value): Successfully resolved names and IP addresses are saved in the cache. ■ *flush*: All positive dynamic entries in the cache are deleted. ■ *disabled*: Successfully resolved names and IP addresses are not saved in the cache and existing dynamic positive entries are deleted.
Negative Cache	Activation of the negative dynamic cache. Possible values: ■ *enabled* (default value): Requested names for which a DNS server has sent a negative answer are saved as negative entries in the cache. ■ *flush*: All negative dynamic entries in the cache are deleted. ■ *disabled*: Names that could not be resolved are not saved in the cache and existing dynamic negative entries are deleted.

Field	Description
Overwrite Global Nameservers	Defines whether the addresses of the global name servers in the gateway (in ***IP*** ➜ ***STATIC SETTINGS***) may be overwritten with name server addresses sent by WAN partners. Possible values: ■ *yes* (default value) ■ *no*
Default Interface	Defines the WAN partner to which a connection is set up for name server negotiation if other name resolution attempts were not successful. The default value is *none*.
DHCP Assignment	Defines which name server addresses are sent to the DHCP client if the gateway is used as DHCP server. Possible values: ■ *none*: No name server address is sent. ■ *self* (default value): The address of the gateway is sent as name server address. ■ *global*: The addresses of the global name servers entered in the gateway are sent.
IPCP Assignment	Defines which name server addresses are sent by the gateway to a WAN partner in dynamic name server negotiation. Possible values: ■ *none*: No name server address is sent. ■ *self*: The address of the gateway is sent as name server address. ■ *global* (default value): The addresses of the global name servers entered in the gateway are sent.
Static Hosts	The number of static entries is shown in brackets.

Field	Description
Forwarded Domains	The number of forwarding entries is shown in brackets.
Dynamic Cache	The number of positive and negative dynamic entries in the DNS cache is shown in brackets.

Table 11-1: ***DNS*** menu fields

This menu provides access to the following submenus:

- ***STATIC HOSTS***
- ***FORWARDED DOMAINS***
- ***DYNAMIC CACHE***
- ***ADVANCED SETTINGS...***
- ***GLOBAL STATISTICS...***

11.1 Static Hosts Submenu

The *IP* ➜ *DNS* ➜ *STATIC HOSTS* submenu is described below.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP] [DNS] [HOSTS] [ADD]                                       MyGateway

 Default Domain:

 Name

 Response      positive

 Address

 TTL           86400

                SAVE                                CANCEL
```

This menu shows a list of Static Hosts already configured. This can be added to or edited in the ***STATIC HOSTS*** ➜ ***ADD/EDIT*** menu.

The menu contains the following fields:

Field	Description
Default Domain	Shows the domain name of the gateway entered in ***IP*** ➜ ***STATIC SETTINGS***.
Name	Host name, which is assigned the ***ADDRESS*** with this static entry. Can also start with the wildcard *, e.g. *.funkwerk-ec.com. If an incomplete name is entered without a dot, this is completed with "***. <DEFAULT DOMAIN>.***" after pressing **SAVE**.
Response	Type of static entry. Possible values: ■ *positive* (default value): A DNS request for ***NAME*** is answered with the associated ***ADDRESS***. ■ *ignore*: A DNS request is ignored; no answer is given. ■ *negative*: A DNS request for ***NAME*** is answered with a negative answer.
Address	Only for ***RESPONSE*** = *positive* IP address that is assigned to ***NAME***.
TTL	Period of validity of the assignment of ***NAME*** to ***ADDRESS*** in seconds (only relevant for ***RESPONSE*** = *positive*), which is sent to requesting hosts. The default value is *86400* (= 24 h).

Table 11-2: ***STATIC HOSTS*** menu fields

11.2 Forwarded Domains Submenu

The *IP* ➜ *DNS* ➜ *FORWARDED DOMAINS* submenu is described below.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][DNS][FORWARDS][ADD]                                        MyGateway

 Global Nameservers: none, Default Interface: none
 Default Domain:

 Name

 Interface     none

 TTL           86400

                SAVE                                  CANCEL
```

This menu shows a list of Forwarded Domains already configured. This can be added to or edited in the ***FORWARDED DOMAINS*** ➜ ***ADD/EDIT*** menu.

The menu contains the following fields:

Field	Description
Global Nameservers	Shows the global name servers entered in ***IP*** ➜ ***STATIC SETTINGS***.
Default Domain	Shows the domain name of the gateway entered in ***IP*** ➜ ***STATIC SETTINGS***.
Name	Host name that is to be resolved with this forwarding entry. Can also start with the wildcard *, e.g. *.funkwerk.de. If an incomplete name is entered without a dot, this is completed with "***.<DEFAULT DOMAIN>.***" after pressing **SAVE**.

Field	Description
Interface	Defines the WAN partner to which a connection is to be set up for the resolution of ***NAME***. The default value is *none*.
TTL	Substitute value for the TTL value supplied by the DNS server in a positive answer, if this is *0* or exceeds ***MAXIMUM TTL FOR POS CACHE ENTRIES***. The TTL value indicates the period of validity of the assignment of the name to the IP address in seconds. The default value is *86400* (= 24 h).

Table 11-3: ***FORWARDED DOMAINS*** menu fields

11.3 Dynamic Cache Submenu

The *IP* ➜ *DNS* ➜ *DYNAMIC CACHE* submenu is described below.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][DNS][DYNAMIC]: Nameservice - Dynamic Cache                MyGateway

 Name                                    Address          Resp  TTL      Ref

    DELETE                STATIC                EXIT
```

The ***MENU IP ➜ DNS ➜ DYNAMIC CACHE*** is used to show the DNS entries learned dynamically by the DNS servers. Here dynamic entries can also be converted to static entries or deleted. The list contains the following columns:

Column	Meaning
Name	Host name to which ***ADDRESS*** is assigned.
Address	IP address that is assigned to ***NAME***.
Resp	Type of dynamic entry. Possible values: ■ *pos* (positive): A DNS request for ***NAME*** is answered with the associated IP address. ■ *neg* (negative): A DNS request for ***NAME*** is answered with a negative answer.
TTL	Shows how many seconds the dynamic entry still remains in the cache. The entry is deleted on expiry of ***TTL***. When a positive dynamic entry is saved in the cache, the value is taken from the answer from the DNS server. If this value is *0* or exceeds ***MAXIMUM TTL FOR POS CACHE ENTRIES***, the value is set to ***MAXIMUM TTL FOR POS CACHE ENTRIES***. For a negative dynamic entry, the value is set to ***MAXIMUM TTL FOR NEG CACHE ENTRIES***. The display is not updated.
Ref	Shows how often the entry has been called.

Table 11-4: ***DYNAMIC CACHE*** menu fields

A dynamic entry can be converted to a static entry by tagging the entry with the **Space** bar and confirming with **STATIC**.

The relevant entry then disappears from ***IP ➜ DNS ➜ DYNAMIC CACHE*** and is listed in ***IP ➜ DNS ➜ STATIC HOSTS***. ***TTL*** is transferred in this operation.

11.4 Advanced Settings Submenu

The *IP* ➜ *DNS* ➜ *ADVANCED SETTINGS* submenu is described below.

```
R232bw Setup Tool               Funkwerk Enterprise Communication GmbH
[IP][DNS][ADVANCED]: Nameservice - Advanced Settings          MyGateway

    Maximum Number of DNS Records        100

    Maximum TTL for Pos Cache entries    86400
    Maximum TTL for Neg Cache Entries    86400

    SAVE               CANCEL
```

The menu contains the following fields:

Field	Description
Maximum Number of DNS Records	Maximum total number of static and dynamic entries. Once this value is reached, the dynamic entry not requested for the longest period of time is deleted when a new entry is added. If ***MAXIMUM NUMBER OF DNS RECORDS*** is reduced by the user, dynamic entries are deleted if necessary. Static entries are not deleted; ***MAXIMUM NUMBER OF DNS RECORDS*** cannot be set to a lower value than the current number of existing static entries. Possible values: *0* .. *1000*. The default value is *100*.

Field	Description
Maximum TTL for Pos Cache entries	For a positive dynamic entry in the cache this is set to ***TTL***, if the TTL field of the DNS record received has the value *0* or exceeds ***MAXIMUM TTL FOR POS CACHE ENTRIES***. The default value is *86400*.
Maximum TTL for Neg Cache Entries	Is set to ***TTL*** for a negative dynamic entry in the cache. The default value is *86400*.

Table 11-5: ***ADVANCED SETTINGS...*** menu fields

11.5 Global Statistics Submenu

The *IP* ➜ *DNS* ➜ *GLOBAL STATISTICS* submenu is described below.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][DNS][STATISTICS]: Nameservice - Global Statistics        MyGateway

  Received DNS Packets                  0
  Invalid DNS Packets                   0

  DNS Requests                          0
  Cache Hits                            0
  Forwarded Requests                    0

  Cache Hitrate (%)                     0

  Successfully Answered Queries         0
  Server Failures                       0

  EXIT
```

Contains the following fields (the menu is updated every second):

Field	Description
Received DNS Packets	Shows the number of received DNS packets addressed direct to the gateway, including the answer packets for forwarded requests.
Invalid DNS Packets	Shows the number of invalid DNS packets received and addressed direct to the gateway.
DNS Requests	Shows the number of valid DNS requests received and addressed direct to the gateway.
Cache Hits	Shows the number of requests that were answered with static or dynamic entries from the cache.
Forwarded Requests	Shows the number of requests forwarded to other name servers.
Cache Hitrate (%)	Shows the number of ***CACHE HITS*** per ***DNS REQUEST*** in %.
Successfully Answered Queries	Shows the number of successfully answered requests (positive and negative).
Server Failures	Shows the number of requests that were not answered by any name server (either positively or negatively).

Table 11-6: ***GLOBAL STATISTICS...*** menu fields

12 DynDNS Submenu

The *DynDNS* menu is described below.

The use of dynamic IP addresses has the disadvantage that a host in the network can no longer be found once its IP address has changed. Dynamic DNS ensures that your gateway can still be reached after changing the IP address.

The following configuration steps are necessary:

- Registration of a host name at a DynDNS provider
- Configuration of the gateway

Registration

The registration of a host name means that you define an individual user name for the DynDNS service, e.g. *dyn_client*. The service providers offer various domain names for this, so that a unique host name results for your gateway, e.g. *dyn_client.provider.com*. The DynDNS provider relieves you of the task of answering all DNS requests concerning the host *dyn_client.provider.com* with the dynamic IP address of your gateway.

To ensure that the provider always knows the current IP address of your gateway, the gateway contacts the provider when setting up a new connection and propagates its present IP address.

Configuration of the gateway

The configuration is set up in ***IP*** ➜ ***DynDNS***. The first menu window contains a list of the entries already configured for using DynDNS services.

```
R232bw Setup Tool              Funkwerk Enterprise Communication GmbH
[IP][DYNDNS]: Dynamic DNS Service                            MyGateway

  DynDNS Services:

Host Name                Interface  Permission    State
dyn_client.provider.com  internet   enabled       up_to_date

 DynDNS Provider List>

     ADD                 DELETE              EXIT
```

From here you can also access the ***IP*** ➜ ***DYNDNS*** ➜ ***DYNDNS PROVIDER LIST*** submenu.

In the ***IP*** ➜ ***DYNDNS*** ➜ ***ADD/EDIT*** menu, you can configure name resolution over a DynDNS provider or change an existing configuration:

```
R232bw Setup Tool                 Funkwerk Enterprise Communication GmbH
[IP][DYNDNS][ADD]                                                MyGateway

  Host Name
  Interface                   en0-1
  User
  Password

  Provider                    dyndns
  MX
  Wildcard                    off
  Permission                  enabled

            SAVE                                    CANCEL
```

The menu contains the following fields:

Field	Description
Host Name	Full host name as registered with the DynDNS provider.
Interface	Defines the WAN interface whose IP address is to be propagated over the DynDNS service (e.g. the interface of the Internet Service Provider).
User	User name as registered with the DynDNS provider.
Password	Password as registered with the DynDNS provider.

Field	Description
Provider	Selection of a preconfigured DynDNS provider. A choice of DynDNS providers is already available in the unconfigured state and their protocols are supported. The default value is *dyndns*.
MX	Full host name of a mail server, to which e-mails are forwarded if the host currently configured is not to receive mail. Ask your provider about this forwarding service and make sure e-mails can be received from the host entered as MX.
Wildcard	Here you can activate the forwarding of all subdomains of ***HOST NAME*** to the current IP address of ***INTERFACE***. Possible values: ■ *on*: The additional name resolution is activated. ■ *off* (default value): The additional name resolution is deactivated.
Permission	Here you can activate or deactivate the DynDNS entry just configured. Possible values are: ■ *enabled* (default value): Entry is activated. ■ *disabled*: Entry is deactivated.

Table 12-1: ***DYNDNS*** menu fields

The ***IP*** ➜ ***DYNDNS*** ➜ ***DYNDNS PROVIDER LIST*** menu shows a list of the preconfigured providers. You cannot edit or delete the preconfigured providers.

A new provider is configured in the ***IP*** ➜ ***DYNDNS*** ➜ ***DYNDNS PROVIDER LIST*** ➜ ***ADD/EDIT*** menu.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP] [DYNDNS] [DYNDNS PROVIDER] [ADD]                              MyGateway

 Name
 Server
 Path
 Port                          80

 Protocol                      dyndns

 Minimum Wait (sec)            300

           SAVE                                    CANCEL
```

The menu contains the following fields:

Field	Description
Name	Here you can give the provider any name you like.
Server	Host name or IP address of the server on which the provider's DynDNS service runs.
Path	Path on the provider's server, where the script for administration of your gateway's IP address can be found. Ask your provider for the path to be used.
Port	Port at which your gateway is to reach your provider's server. Ask your provider for the relevant port. Default value: *80*.

Field	Description
Protocol	Here you select one of the protocols implemented. The following are available: ■ *dyndns* (default value) (www.dyndns.org) ■ *static dyndns* (www.dyndns.org) ■ *ods* (http://www.ods.org) ■ *hn* (http://hn.org) ■ *dyns* (http://dyns.cx) ■ *GnuDIP HTML* (http://gnudip2.sourceforge.net) ■ *GnuDIP TCP* (http://gnudip2.sourceforge.net) ■ *custom dyndns* (www.dyndns.org)
Minimum Wait (sec)	Here you enter the minimum time (in seconds) that the gateway must wait before it is allowed to propagate its current IP address to the DynDNS provider again. The default value is *300* seconds.

Table 12-2: ***DynDNS Provider List*** ➜ ***ADD/EDIT*** menu fields

13 Routing Protocols Submenu

The *ROUTING PROTOCOLS* menu is described below.

```
R232bw Setup Tool              Funkwerk Enterprise Communication GmbH
[IP][ROUTING]: Routing protocols                              MyGateway

               Routed                    running

               RIP >

               SAVE                      CANCEL
```

The contents of a gateway's routing table can be configured statically. A gateway also has the option of updating its routing tables dynamically by exchanging information with other gateways. This information exchange is specified in a routing protocol.

Routing protocols allow the gateway to adapt to changing network conditions dynamically and quickly find the best routing solutions in complex networks. One of the most frequently used routing protocols is ***RIP***. It is explained briefly in the following chapters.

The ***ROUTING PROTOCOLS*** submenu is part of the ***IP*** menu. This shows the state of the Routing Daemon (***ROUTED***) and enables it to be activated or deactivated (with ***ROUTED*** = *running* or *stopped*).

The possible states of the Routing Daemon are:

- *running*: Activates RIP (dependent on the interface-specific RIP configuration) and OSPF.
- *stopped*: Deactivates RIP (dependent on the interface-specific RIP configuration) and OSPF.

The ***IP*** ➜ ***ROUTING PROTOCOLS*** menu also provides access to the ***RIP*** submenu.

The use of the routing protocols is activated globally in the ***IP*** ➜ ***ROUTING PROTOCOLS*** ➜ ***ROUTED*** menu. RIP is also activated on the respective interface by selecting the relevant protocol version in ***RIP SEND*** or ***RIP RECEIVE***.

13.1 RIP Submenu

The *RIP* menu is described below.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][ROUTING][RIP]: RIP configuration                          MyGateway

      UDP port                              520

      Static Settings >

      Timer >

      Filter >

      SAVE                                  CANCEL
```

The ***IP*** ➜ ***ROUTING PROTOCOLS*** ➜ ***RIP*** menu is used for making global RIP settings. The activation of RIP is set specific to interface in ***IP*** ➜ ***ADVANCED SETTINGS*** of the respective interface menu.

A gateway exchanges routing information with other gateways using the RIP (Routing Information Protocol). A gateway sends messages to remote networks every 30 seconds using information from its own current routing table. The complete routing table is always exchanged in this process. If triggered RIP is used, information is only exchanged if the routing information has changed and only the changed information is sent.

Observing the information sent by other gateways enables new routes and shorter paths for existing routes to be saved in the routing table. As intermediate routes between networks can become unreachable, RIP removes routes that

are older than 5 minutes (i.e. routes not verified in the last 300 seconds). Routes learnt are not deleted if triggered RIP is used.

Note

The setting option ***UDP PORT***, which is used for sending and receiving RIP updates, is only for test purposes. If the setting is changed, this can mean that the gateway sends and listens at a port to which no other gateways react. The default value *520* should be retained.

The ***IP*** ➜ ***ROUTING PROTOCOLS*** ➜ ***RIP*** menu provides access to three other submenus, in which you can define exactly how RIP updates are handled:

- ***STATIC SETTINGS***
- ***TIMER***
- ***FILTER***.

13.1.1 Static Settings Submenu

The *STATIC SETTINGS* menu is described below.

```
R232bw Setup Tool               Funkwerk Enterprise Communication GmbH
[IP][ROUTING][RIP][STATIC]: RIP Static Settings              MyGateway

      Default Route distribution         enabled
      Poisoned Reverse                   disabled
      RFC 2453 variable timer            enabled
      RFC 2091 variable timer            disabled

      SAVE                               CANCEL
```

The ***IP*** ➜ ***ROUTING PROTOCOLS*** ➜ ***RIP*** ➜ ***STATIC SETTINGS*** menu is for configuring basic RIP parameters. It contains the following fields:

Field	Description
Default Route distribution	Here you determine whether the default route of your gateway is to be propagated via RIP updates. Possible values: ■ *disabled* ■ *enabled* The default value is *enabled*.
Poisoned Reverse	Procedure for preventing routing loops With standard RIP, the routes learnt are propagated over all interfaces with ***RIP SEND*** activated. With ***POISONED REVERSE***, the gateway propagates over the interface over which it learnt the routes, with the metric (Next Hop Count) 16 (=“Network is not reachable“). Possible values: ■ *disabled* ■ *enabled* The default value is *disabled*.
RFC 2453 variable timer	Here you can determine whether the timers described in RFC 2453 are to use the values you can configure in the ***IP*** ➜ ***ROUTING PROTOCOLS*** ➜ ***RIP*** ➜ ***TIMER*** menu. Possible values are: ■ *disabled* ■ *enabled* (default value) If you select *disabled*, the times defined in RFC are retained for the timeouts.

Field	Description
RFC 2091 variable timer	Here you can determine whether the timers described in RFC 2091 are to use the values you can configure in the ***IP*** ➜ ***ROUTING PROTOCOLS*** ➜ ***RIP*** ➜ ***TIMER*** menu. Possible values are: ■ *disabled* (default value) ■ *enabled* If you keep the *disabled* setting, the times defined in RFC are retained for the timeouts.

Table 13-1: ***STATIC SETTINGS*** menu fields

The timers that can be activated in the ***STATIC SETTINGS*** menu are configured in the ***IP*** ➜ ***ROUTING PROTOCOLS*** ➜ ***RIP*** ➜ ***TIMER*** menu.

13.1.2 Timer Submenu

The *TIMER* menu is described below.

```
R232bw Setup Tool               Funkwerk Enterprise Communication GmbH
[IP][ROUTING][RIP][TIMER]: RIP timer configuration           MyGateway

       Timer for RIP V2 (RFC 2453)
       ---------------------------
       Update Timer                        30
       Route Timeout                       180
       Garbage Collection Timer            120

       Timer for Triggered RIP (RFC 2091)
       ----------------------------------
       Hold down timer                     120
       Retransmission timer                5

             SAVE                                  CANCEL
```

In this menu you can configure the timers defined by RFC 2091 and RFC 2453 for the various events in the lifetime of a route.

The menu is divided into fields for configuration of the ***RIP-V2 TIMER (RFC 2453)*** and ***TRIGGERED-RIP TIMER (RFC 2091)***.

The ***TIMER*** menu contains the following fields (all timers are stated in seconds):

Field	Description
Update Timer	An RIP update is sent on expiry of this period of time. The default value is *30*.
Route Timeout	The ***ROUTE TIMEOUT*** is activated after the last update of a route. After timeout, the route is deactivated and the ***GARBAGE COLLECTION TIMER*** is started. The default value is *180*.
Garbage Collection Timer	The ***GARBAGE COLLECTION TIMER*** is started as soon as the route timeout has expired. After this timeout, the invalid route is deleted from the ***IPROUTETABLE*** if no further update is received for the route. The default value is *120*.
Hold down timer	The ***HOLD DOWN TIMER*** is activated as soon as the gateway contains an unreachable route (metric 16). After this timeout, the route is deleted from the ***IPROUTETABLE***, if applicable. The default value is *120*.

Field	Description
Retransmission timer	After this timeout, update request or update response packets are sent again until an update flush or update acknowledge packet arrives. The default value is *5*.

Table 13-2: ***TIMER*** menu fields

13.1.3 Filter Submenu

The *FILTER* menu is described below.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][ROUTING][RIP][FILTER]: RIP Distribution Filter            MyGateway

 Interface   Direction   State    IP Address    Netmask    Priority

   ADD                 DELETE              EXIT
```

In the ***IP*** ➜ ***ROUTING PROTOCOLS*** ➜ ***RIP*** ➜ ***FILTER*** menu, you can define exactly which routes are to be exported or imported.

You can use the following strategies for this:

- You explicitly deactivate the import or export of certain routes. The import or export of all other routes that are not listed is still allowed.
- You explicitly activate the import or export of certain routes. In this case, you must also explicitly deactivate the import or export of all other routes. You can do this using a filter for ***IP ADDRESS*** = no entry (this corresponds to the IP address 0.0.0.0) with ***NETMASK*** = no entry (this corresponds to the netmask 0.0.0.0) and ***DISTRIBUTION*** = *disabled*. To make sure this filter is used last, you must assign it the lowest priority.

You configure a filter for a default route with the following values:

- ***IP ADDRESS*** = no entry (this corresponds to the IP address 0.0.0.0) with ***NETMASK*** = *255.255.255.255*.

The first menu window shows a list of the filters already configured.

The fields shown correspond to the options configurable in the ***ADD/EDIT*** submenu. The value for the ***DISTRIBUTION*** variable is shown under ***STATE***.

```
R232bw Setup Tool                Funkwerk Enterprise Communication GmbH
[IP][ROUTING][RIP][FILTER][ADD]: Define RIP Filter              MyGateway

        Interface                                 en1-0
        IP Address
        Netmask
        Priority                                  1
        Direction                                 import
        Distribution                              disabled
        Metric1 offset on interface up            0
        Metric1 offset on interface dormant       0

                SAVE                                  CANCEL
```

The ***FILTER*** ➜ ***ADD/EDIT*** menu contains the following fields:

Field	Description
Interface	Here you define the interface to which the rule to be configured applies.
IP Address	Here you enter the IP address to which the rule is to be applied. This address can be in the LAN or WAN. The rules for incoming and outgoing RIP packets (import or export) for the same IP address must be separately configured. You can enter individual host addresses or network addresses.
Netmask	Here you enter the netmask of ***IP ADDRESS***.

Field	Description
Priority	Here you enter the priority with which the filter is to be used. If different filters with overlapping IP address range exist, the filter with the higher priority is used first. This enables a single host route to be imported from an IP address range that is actually disabled, if the rule that allows this has a higher priority than the rule that disables the address range. Possible values are *1* to *16*, where *1* corresponds to the highest priority. The default value is *1*.
Direction	Here you define whether the filter applies to the export or import of routes. Possible values are: ■ *import* ■ *export.* The default value is *import*.
Distribution	Here you define whether this filter allows or denies export or import from/to the gateway. Possible values are: ■ *enabled* ■ *disabled* The default value is *disabled*.
Metric1 offset on interface up	Here you enter whether and to what extent the metric of an imported or exported route is to be changed if the interface concerned is active (up). Possible values are *-16* to *16*. The default value is *0*.

Field	Description
Metric1 offset on interface dormant	Here you enter whether and to what extent the metric of an imported or exported route is to be changed if the interface concerned is inactive (dormant). Possible values are *-16* to *16*. The default value is *0*.
