Software release V2.200

Release V2.200 is made to add additional features and to correct some faults. Refer to the table below for the contents.

Firmware elmeg System phone S530/S560

Files: elmeg-S560_V2.200.bin
                              elmeg-S530_V2.200.bin

The following functions have been added.

No.	New functions and changes
01	**Advanced call waiting functions** The phone is now able to accept up to four additional calls in all connection states. The display always shows the oldest call that is not yet connected.
02	**MSN-Key** The MSN key offers the possibily to establish a connecting using an other than the default MSN (MSN-1). Pressing the key during a connection starts an inquiry call which is identified with the MSN that is assigned to the key. The LED which is assigned to the key lights permanently if a connection is active using the MSN or there is an incoming call to this MSN an the call is shown in the display.
03	**Display of UUS imformation** **Alarm-Call**: UUS information transmitted within an ALARM call is shown in the display during the ringing state **Generally:** UUS information transmitted during any call is stored in the caller list and is shown together with all other informations from the list.

The following errors have been corrected

No.	Bugfix
01	**Bugfix: ARS 18206** Dial keys located on a T500 which were programmed on the phone were not permanently stored in the PBX.
02	**Bugfix: ARS 18425** S5x0 with an extension modul T500 was no longer registered as „ system phone" after a reset of the PBX and therefore the LEDs did not show the right states.
