Table of Contents

Chapter 1	Important Information	1
1.1	Preparation and update with the GUI	1
1.2	Downgrade with the GUI	2
1.3	Supported web browsers	2
Chapter 2	New Functions	4
2.1	IPv4 filter rules	4
2.2	IPv6	5
2.2.1	Interfaces	7
2.2.2	IPv6 Route Configuration	16
2.2.3	IPv6 Routing Table	18
2.2.4	General Prefix Configuration	19
2.2.5	IPv4/IPv6 Filter	21
2.2.6	PPPoE	22
2.2.7	PPPoA	24
2.2.8	IPSec Peers	27
2.2.9	IPv6 Filter Rules	30
2.2.10	IPv6 Groups	33
2.2.11	Address List	34
2.2.12	Groups	35
2.2.13	DNS Servers	35
2.2.14	DHCPv6-Server	37
2.2.15	DHCPv6 Global Options	40
2.2.16	Stateful Clients	42
2.2.17	Stateful Clients Configuration	42
2.2.18	Ping Test	44
2.2.19	Traceroute Test	45
2.3	IPSec - New algorithms	45

2.4	IKEv2 Routing	46
2.5	Maintenance - new options (hybrid)	47
2.6	SIA	47
2.7	Factory reset	47
2.8	Display manufacturer via MAC address	47
2.9	New DNS menu	47
2.9.1	Dynamic Hosts	47
2.10	Log out Users	48
2.10.1	Log out Users	48
2.11	Automatic VDSL/ADSL mode	49
2.12	Firewall - Reset.	49
2.13	Emergency calls	49
2.14	elmeg IP680 available	50
2.15	Telephones in teams	50
Chapter 3	Changes	51
3.1	Password change when you first log on.	51
3.2	PBX assistant upgraded	51
3.3	Designation adjusted	51
3.4	Menu description changed	51
3.5	Domain forwarding changed	51
3.6	VDSL - TCP Upstream Performance improved	52
3.7	LEDs for bintec RS353jv-4G changed	52
3.8	SIP connections improved	53

Chapter 4	Troubleshooting.	54
4.1	Stacktrace:	54
4.2	Panic (hybird 600)	54
4.3	Assistants - Internet assistant incorrect	54
4.4	Internet assistant - Incorrect parameter	54
4.5	Problems with Telekom Speedstick LTE V	55
4.6	Internet connection down	55
4.7	The same icon for different actions	55
4.8	Error message incorrect	55
4.9	Entries cannot be deleted	56
4.10	Unintentional separation of a connection (hybird)	56
4.11	Firmware update failed	56
4.12	LTE - Echo request packets did not reach their destination	56
4.13	Roaming problems	56
4.14	SSH - Connection failed	57
4.15	Wrong page	57
4.16	Configuration session incomplete	57
4.17	Windows 10 Edge Browser - Unwanted line breaks	57
4.18	Connection failures (hybird)	57
4.19	SSL - No transmission of configuration files.	58
4.20	FAX not working correctly	58
4.21	VoIP - No voice transmission	58
4.22	VoIP - Account not usable	58

4.23	VoIP - Provider problems	58
4.24	WLAN Controller - WTP does not work correctly	59
4.25	WLAN controller - Stacktrace.	59
4.26	Network - Reboots	59
4.27	QoS - no classification of high priority packets	59
4.28	QoS - Configuration incorrect.	59
4.29	QoS - 1TR112 requirements not met	60
4.30	Codec problems	60
4.31	Codec problems (hybird 600).	60
4.32	SIP - connection terminated	60
4.33	SIP - Calls rejected	60
4.34	SIP - Incoming calls ignored	61
4.35	SIP - Incorrect format	61
4.36	Telephony - Calls not possible	61
4.37	Telephony - Incorrect connection data	61
4.38	Telephony - Provisioning problems	61
4.39	Telephony - Voice connections incorrect (hybird)	62
4.40	PBS - registration process delayed	62
4.41	DISA problem (hybird).	62
4.42	Network - Full cone NAT.	62
4.43	PPP - No dialin	62
4.44	ISDN - Call terminated	63
4.45	IPSec - No data traffic	63
4.46	SIF - Alias problems	63

4.47	DNS not working	63
4.48	HTTPS - Certificate selection possible by mistake	63
4.49	DynDNS-Client - Input option incorrect	64
4.50	Local services - Scheduling incorrect	64
4.51	Incorrect alert message	64
4.52	Hotspot-Gateway - Storage problem	64
4.53	Hotspot gateway - Timeout cannot be switched off	64
4.54	External reporting - alert service not working correctly	65
4.55	Monitoring - Keepalive Monitoring incorrect	65
4.56	MIB-Tabelle ipsecPeerTable not changable	65

Chapter 1 Important Information

1.1 Preparation and update with the GUI

Updating the system software with the Graphical User Interface (GUI) is done using a BLUP (bintec Large Update) file so as to update all the necessary modules intelligently. All those elements that are newer in the BLUP than on your gateway are updated.

Note

The result of an interrupted updating operation could be that your gateway no longer boots. Hence, do not turn your gateway off during the update.

To prepare and carry out any update to **Systemsoftware 10.1.3** using the Graphical User Interface, proceed as follows:

- (1) For the update, you'll need the `XXXXXX_b11014.xxx` file, where `XXXXXX` stands for you device. Ensure that the file that you require for the update is available on your PC. If the file is not available on your PC, enter www.bintec-elmeg.com in your browser. The bintec-elmeg homepage will open. You will find the required file in the download area for your gateway. Save it on your PC.
- (2) Backup the current boot configuration before updating. Export the current boot configuration using the **Maintenance->Software & Configuration** menu in the Graphical User Interface. To do this, select: **Action** = *Export configuration*, **Current File Name in Flash** = *boot*, **Include certificates and keys** = *enabled*, **Configuration Encryption** = *disabled*. Confirm with **Start**. The **Open <name of gateway>.cf** window opens. Leave the selection *Save file* and click **OK** to save the configuration to your PC. The file `<name of gateway>.cf` is saved and the **Downloads** window shows the saved file.
- (3) Update to **Systemsoftware 10.1.3** via the **Maintenance->Software & Configuration** menu. To do this, select: **Action** = *Update system software*, **Source Location** = *Local File*, **Filename** = `XXXXXX_b19110.xxx`. Confirm with **Start**. The message "System request. Please stand by. Operation in progress." or "System Maintenance. Please stand by. Operation in progress." shows that the selected file is being uploaded to the device. When the upload procedure is finished, you will see the message "System - Maintenance. Success. Operation completed successfully." Click **Reboot**. You will see the message "System - Reboot. Rebooting. Please wait. This takes approximately 40 seconds." The device will start with the new system software, and the browser window will open.

1.2 Downgrade with the GUI

If you wish to carry out a downgrade, proceed as follows:

- (1) Replace the current boot configuration with the previous backup version. You import the saved boot configuration using the **Maintenance->Software & Configuration** menu. To do this, select: **Action** = *Import configuration*, **Configuration Encryption** = *disabled*, **Filename** = *<name of the device>.cf*. Confirm with **Start**. The message "System request. Please stand by. Operation in progress." or "System Maintenance. Please stand by. Operation in progress." indicates that the selected configuration is being uploaded to the device. When the upload procedure is finished, you will see the message "System - Maintenance. Success. Operation completed successfully." Click **Reboot**. You will see the message "System - Reboot. Rebooting. Please wait. This takes approximately 40 seconds." The device will start and the browser window will open. Log into your device.
- (2) Downgrade to the software version you want using the **Maintenance->Software & Configuration** menu.
To do this, select: **Action** = *Update system software*, **Source Location** = *Local File*, **Filename** = *RXL_Series_b19109.biq* (example). Confirm with **Start**. The message "System request. Please stand by. Operation in progress." or "System Maintenance. Please stand by. Operation in progress." shows that the selected file is being uploaded to the device. When the upload procedure is finished, you will see the message "System - Maintenance. Success. Operation completed successfully." Click **Reboot**. You will see the message "System - Reboot. Rebooting. Please wait. This takes approximately 40 seconds." The device will start with the new system software, and the browser window will open.

You can log into your device and configure it.

1.3 Supported web browsers

The HTML GUI supports the use of the following browsers, each in their latest version:

- Microsoft Internet Explorer
- Mozilla Firefox
-

**Important**

Ensure that you keep your browser updated to the latest version, since you need to do so to take advantage of new functions and security features. The HTML GUI does not support versions that are no longer supported by the manufacturer and supplied with software updates. If necessary, go to the software manufacturer's website to find out which versions they currently support.

Chapter 2 New Functions

Systemsoftware 10.1.3 includes a number of new functions that significantly improve performance compared to the previous version of the system software.

Note

Please note that not all the functions listed here are available for every device. Please refer, if necessary, to the current data sheet for your device or to the relevant manual.

2.1 IPv4 filter rules

Note

From **Systemsoftware 10.1.3** onwards, the IPv4 filter rules concept has changed fundamentally.

In IPv4, trustworthy or non-trustworthy zones are available in a comparable manner, as in IPv6. In the SIF, at first all LAN interfaces are considered trustworthy, all WAN interfaces as non-trustworthy.

In the **Firewall->Guide lines->IPv4 Filter Rules** menu, you can display an IPv4 interface list using the  button under **Trustworthy Interfaces** and identify which interfaces are trustworthy.

Furthermore, in IPv4 the following menus and fields are affected:

- in the **LAN->IP-configuration->Interfaces->**  menu, the **Security Policy field**
- the **WAN->Internet + Dialup->PPPoE->New**, **WAN->Internet + Dialup->PPTP->NEW**, **WAN->Internet +Dialup->PPPoA->New** menus
- the **VPN->IPSec->IPSec-Peers->New** menu

2.2 IPv6

Important

The following functions can NOT be used with IPv6:

- Load balancing: The function is not applicable on IPv6 interfaces because the IPv6 data traffic is not recorded.
- Hotspot Gateway: IPv6 data traffic is not recorded by Hotspot Gateway and can therefore, not be controlled and restricted, if necessary.
- IPv6 tunnel mechanisms for transferring IPv6 data through IPv4 networks (6in4 Relay, SixXS, Hurricane Electric, 6to4 RFC) are no longer supported. Configurations making use of these mechanisms are incompatible with **Systemsoftware 10.1.3**.

With **Systemsoftware 10.1.3** IPv6 is available for selected bintec routers.

Configure IPv6 addresses

In addition to IPv4 addresses, you can use IPv6 addresses.

In the following, there is an example of an IPv6 address:

Fig. 1: IPv6 address (example)

On an interface, your device can either run as a router or host. On a LAN interface, it usually runs as a router and on WAN as well as PPP connections it runs as a host.

If your device runs as a router, its own IPv6 addresses can be formed as follows: a link-prefix can be derived from a general prefix (see **IPv6 General Prefixes** further below) or you can enter the static value. A host address can be generated via *Auto EUI-64*, you can enter static values for other host addresses.

If your device runs as a router, it usually distributes the configured link-prefix to hosts via router advertisements. Additional information, e.g., the time server address is transmitted to the hosts via the DHCP servers. The client can generate his/her host address either via Stateless Address Autoconfiguration (SLAAC) or have these addresses assigned by a DH-

CP server.

For the aforementioned router mode in the **LAN->IP Configuration->Interfaces->New** menu use the **IPv6 Mode** = *router*, **Transmit Router Advertisement** *Enabled* **DHCP Server** *Enabled* and **IPv6 Addresses Add** settings.

If your devices runs as a host, a link-prefix from another router is assigned to it via router advertisement. The host address is automatically generated via SLAAC. Additional information, e.g. general prefix of the provider or the address of a time server can be obtained via DHCP. To do so, in the **LAN->IP Configuration->Interfaces->New** menu, use the **IPv6 Mode** = *Client*, **Accept Router Advertisement** *Enabled* and **DHCP Client** = *Enabled* settings.

IPv6 General Prefixes

IPv6 General Prefixes are usually assigned by IPv6 providers. They can be statically assigned or obtained via DHCP. It usually has to do with /48- or /56- networks. You can generate /64-subnets from these general prefixes and have them redistributed in your network.

The general prefix concept has two decisive advantages:

- A single route is sufficient between the provider and client.
- If the provider assigns a new general prefix via DHCP or must change a statically assigned general prefix, you as the customer have little or no configuration expenditure. You will automatically receive the new general prefix via DHCP. In case of the statically assigned general prefix, you must enter this into your system once. All subnets and IPv6 addresses derived from this general prefix change automatically change if the general prefix is updated.

Menus

The following menus are provided for defining the IPv6 configuration:

- **Assistants->First Steps->Basic Settings**: Here you can define basic IPv6 settings using the **First steps** assistant. Explanations of the displayed IPv6 parameters can be found directly in the GUI in the right window.
- **Assistants->Internet Access->Internet Connections**: Here you can configure IPv6 settings for an internet connection using the **Internet Access** assistant. Explanations of the displayed IPv6 parameters can be found directly in the GUI in the right window.
- **LAN->IP Configuration->Interfaces->New**: Here you can configure the desired IPv6 interfaces (see [Interfaces](#) on page 7).
- **LAN->IP Configuration->Interfaces->** : Here you can view all the IPv4 and IPv6 addresses of the corresponding interfaces.

- **Networking->Routes->IPv6 Route Configuration**: In this menu you can define new IPv6 routes or edit existing routes (see [IPv6 Route Configuration](#) on page 16).
- **Networking->Routes->IPv6 Routing Table**: Here, a list of all IPv6 routes active in the system are displayed.
- **Networking->IPv6 General Prefixes->General Prefix Configuration**: Here you can create new general prefixes for IPv6 or change previously created general prefixes (see [General Prefix Configuration](#) on page 19).
- **Networking->QoS->IPv4/IPv6 Filter**: Here you can configure IPv4 and IPv6 filters (see [IPv4/IPv6 Filter](#) on page 21).
- **WAN->Internet + Dialup->PPPoE->New**: Here you can configure IPv6 for PPPoE (see [PPPoE](#) on page 22).
- **WAN->Internet + Dialup->PPPoA->New**: Here you can configure IPv6 for PPPoA (see [PPPoA](#) on page 24).
- **VPN->IPSec->IPSec Peers->New**: Here you can configure IPv6 for IPSec (see [IPSec Peers](#) on page 27).
- **Firewall->Policies->IPv6 Filter Rules->New**: Here you can configure filter rules for IPv6 (see [IPv6 Filter Rules](#) on page 30).
- **Firewall->Interfaces->IPv6 Groups->New**: You can combine IPv6 interfaces for groups (see [IPv6 Groups](#) on page 33).
- **Firewall->Addresses->Address List**: Here, a list of all configured addresses is displayed. You can create new (IPv6) addresses (see [Address List](#) on page 34).
- **Firewall->Addresses->Groups->New**: You can combine addresses for groups (see [Groups](#) on page 35).
- **Local Services->DNS->DNS Servers->New**: Here you can create a DNS server for IPv6 (see [DNS Servers](#) on page 35).
- **Local Services->DNS->Dynamic Hosts**: Here, the learned DNS entries are displayed via DHCPv6 (see [Dynamic Hosts](#) on page 47). For example, you will see the IPv6 addresses assigned via DHCPv6.
- **Local Services->DHCPv6 server**: here, you can configure your device as a DHCPv6 server (see [DHCPv6-Server](#) on page 37 and [DHCPv6 Global Options](#) on page 40).
- **Maintenance->Diagnostics->Ping Test** (see [Ping Test](#) on page 44)
- **Maintenance->Diagnostics->Traceroute Test** (see [Traceroute Test](#) on page 45)

2.2.1 Interfaces

The existing IP interfaces are listed in the **LAN->IP Configuration->Interfaces** menu. You can see IPv6 address that have already been created for interfaces.

2.2.1.1 Edit or New

Select the  icon to edit existing entries. Choose the **New** button to create virtual interfaces.

Fig. 2: LAN->IP Configuration->Interfaces->New

The LAN->IP Configuration->Interfaces->New menu contains the following fields relevant for IPv6:

Fields in the menu Basic IPv6 Parameters

Field	Description
IPv6	<p>Select whether the selected interface is to use Internet Protocol version 6 (IPv6) for data transmission.</p> <p>The function is activated by selecting <i>Enabled</i>.</p> <p>The function is disabled by default.</p>
Security Policy	<p>Here only for IPv6 = Enabled</p> <p>Select the security settings to be used with the interface.</p>

Field	Description
	<p>Possible values:</p> <ul style="list-style-type: none"> • <i>Trusted</i> (default value): All IP packets are allowed through except for those which are explicitly prohibited. <p>We recommend you use this setting if you want to use IPv6 on your LAN.</p> <ul style="list-style-type: none"> • <i>Untrusted</i>: Only those IP packets that can be assigned to a connection, which were set-up from a trustworthy zone are allowed through. <p>We recommend you use this setting if you want to use IPv6 outside of your LAN.</p> <p>You can configure exceptions for the selected setting in the Firewall menu.</p>
IPv6 Mode	<p>Only for IPv6 = <i>Enabled</i></p> <p>Select whether the interfaces are to be operated in the host or router mode. Depending on the selection made, different parameters are displayed, which you must configure.</p> <p>Possible values:</p> <ul style="list-style-type: none"> • <i>Router (Transmit Router Advertisement)</i> (default value): The interface is operated in router mode. • <i>Host</i>: The interface is operated in host mode.
Transmit Router Advertisement	<p>Only for IPv6 = <i>Enabled</i> and IPv6 Mode = <i>Router (Transmit Router Advertisement)</i></p> <p>Select whether router advertisements are to be sent via the selected interface.</p> <p>With the help of router advertisements, e.g., the prefix list is transmitted and the router is propagated as a standard gateway.</p> <p>The function is activated by selecting <i>Enabled</i>.</p> <p>The function is enabled by default.</p>
DHCP Server	<p>Only for IPv6 = <i>Enabled</i> and IPv6 Mode = <i>Router (Transmit Router Advertisement)</i></p>

Field	Description
	<p>Determine whether your device is to be run as a DHCP server, i.e., whether it is to send DHCP options to forward, e.g., information on the DNS servers to clients.</p> <p>Activate this option if hosts are to generate IPv6 addresses via SLAAC.</p> <p>The function is activated by selecting <i>Enabled</i>.</p> <p>The function is enabled by default.</p>
IPv6 Addresses	<p>Only for IPv6 = <i>Enabled</i></p> <p>You can allocate IPv6 Addresses to the selected interface.</p> <p>With Add you can create one or several address entries.</p> <p>An additional window is opened, where you can determine a IPv6 address comprising a link prefix and a host share.</p> <p>If your device works in the host mode (IPv6 Mode = <i>Host</i>, Accept Router Advertisement <i>Enabled</i> and DHCP Client <i>Enabled</i>), its IPv6 addresses are determined via SLAAC. You are not required to manually configure IPv6 addresses, but can key in additional addresses if desired.</p> <p>If your device works in the router mode (IPv6 Mode = <i>Router (Transmit Router Advertisement)</i>, Transmit Router Advertisement <i>Enabled</i> and DHCP Server <i>Enabled</i>), then you must also configure it IPv6 addresses.</p>
Accept Router Advertisement	<p>Only for IPv6 = <i>Enabled</i> and IPv6 Mode = <i>Host</i></p> <p>Select whether router advertisements are to be received via the selected interface. With the help of router advertisement, e.g., the prefix list is created.</p> <p>The function is activated by selecting <i>Enabled</i>.</p> <p>The function is enabled by default.</p>
DHCP Client	<p>Only for IPv6 = <i>Enabled</i> and IPv6 Mode = <i>Host</i></p> <p>Determine whether your device is to be run as a DHCP client, i.e., whether it is to receive DHCP options to forward, e.g., in-</p>

Field	Description
	formation on the DNS servers.
	The function is activated by selecting <i>Enabled</i> .
	The function is enabled by default.

If you click on **Add**, an additional window opens.

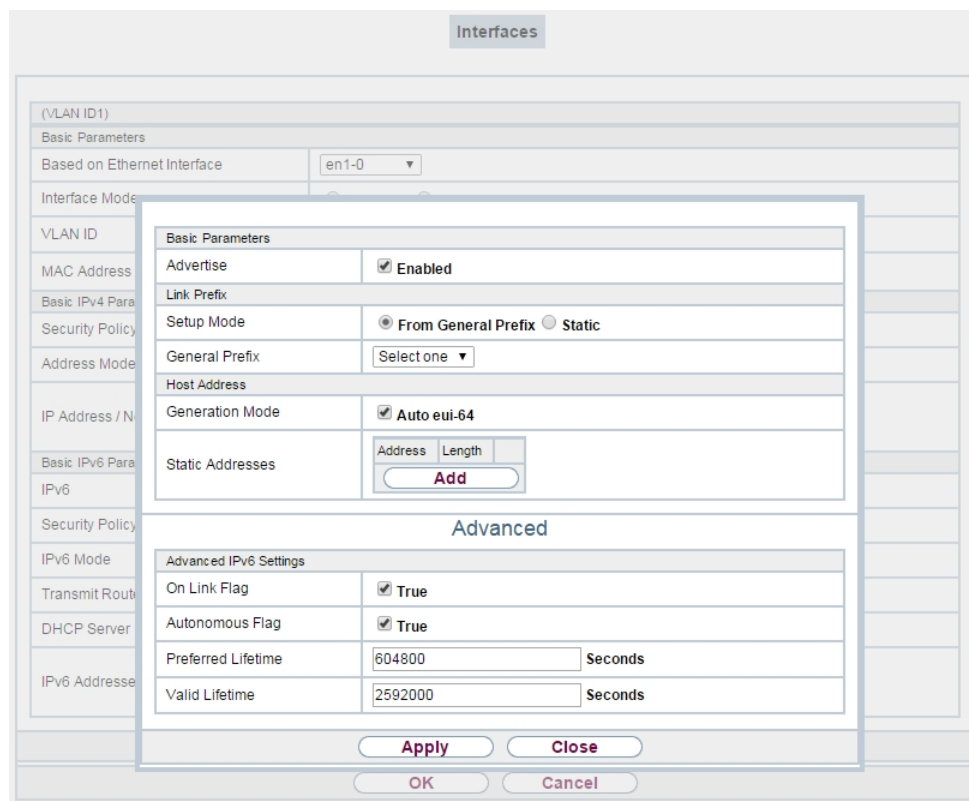

Fig. 3: LAN->IP Configuration->Interfaces->New->Add

Field in the menu Basic Parameters

Field	Description
Advertise	Only for IPv6 Mode = Router (<i>Transmit Router Advertisement</i>) Here, - with regard to the link prefix that is defined in the current window - you can define whether this prefix is to be sent via

Field	Description
	<p>router advertisement via the selected interface.</p> <p>The function is activated by selecting <i>Enabled</i>.</p> <p>The function is enabled by default.</p>

Fields in the menu Link Prefix

Field	Description
Type of set-up	<p>Select how the link prefix is to be determined.</p> <p>Possible values:</p> <ul style="list-style-type: none"> • <i>From General Prefix</i> (default value): The link prefix is derived from a general prefix. • <i>Static</i>: You can enter the link prefix.
General Prefix	<p>Only for type of set-up = <i>From General Prefix</i></p> <p>Select the general prefix which the link prefix is to be derived from. You can select among the general prefixes which are created under Network->IPv6 General Prefixes->General Prefix Configuration->New (see General Prefix Configuration on page 19).</p>
Auto Subnet Configuration	<p>Only if type of set-up = <i>From General Prefix</i> and if a General Prefix is selected.</p> <p>Select whether the subnet is to be created automatically. In automatic subnet configuration, the ID 0 is used for the first subnet, the second subnet uses the subnet ID 1, etc.</p> <p>Possible values for the Subnet ID are 0 to 65535.</p> <p>The subnet ID describes the fourth of the four 16-bit fields of a link prefix. In subnet configuration, the decimal ID value is converted to a hexadecimal value.</p> <p>The function is activated by selecting <i>Enabled</i>.</p> <p>The function is enabled by default.</p> <p>If the function is not active, you can define a subnet by entering the subnet OD.</p>

Field	Description
Subnet ID	<p>Only if Auto Subnet Configuration is not enabled.</p> <p>Enter the subnet ID to define a subnet. The subnet ID describes the fourth of the four 16-bit fields of a link prefix.</p> <p>Possible values are <i>0</i> to <i>65535</i>.</p> <p>In subnet configuration, the entered decimal ID value is converted to a hexadecimal value.</p>
Link Prefix	<p>Only for type of set-up = <i>Static</i></p> <p>You can enter the link prefix of a IPv6 address. This prefix must end with <i>::</i>. It's length is specified with <i>64</i>.</p>

Fields in the menu Host Address

Field	Description
Generation method	<p>Determine whether the host share of the IPv6 address is to be automatically generated from the MAC address using EUI-64.</p> <p>The function is activated by selecting <i>Enabled</i>.</p> <p>The function is enabled by default.</p> <p>EUI-64 starts up the following process.</p> <ul style="list-style-type: none"> • The hexadecimal 48 bit MAX address is divided into 2 x 24 bit. • <i>FFFE</i> is entered in the gap created to maintain 64 bit. • The hexadecimal form of 64 bit is transformed into the dual form. • In the first 8 bit field, bit 7 is placed on <i>1</i>.
Static Addresses	<p>Irrespective of the automatic generation that is specified under Generation methods, you can manually enter the host share of one or several IPv6 addresses using Add. It's length is specified with <i>64</i>. Start your entry with <i>::</i>.</p>

The fields in the **Advanced** menu are a component of the prefix information which are sent in the router advertisement, if **Advertise** is enabled. The menu **Advanced** consists of the following fields:

Fields in the menu Advanced IPv6 Settings

Field	Description
On Link Flag	<p>Select whether the On-Link Flag (L-Flag) should be set.</p> <p>This allows the host to enter the prefix from the prefix list.</p> <p>The function is activated by selecting <i>True</i>.</p> <p>The function is enabled by default.</p>
Autonomous Flag	<p>Select whether the Autonomous Address Configuration Flag (A-Flag) should be set.</p> <p>This allows the host to use the prefix and an interface ID, to derive its address.</p> <p>The function is activated by selecting <i>True</i>.</p> <p>The function is enabled by default.</p>
Preferred Lifetime	<p>Enter a time period in seconds. During this time, the addresses that are created with the help of the prefix via SLAAC, are used preferentially.</p> <p>The default value is <i>604800</i> seconds.</p>
Valid Lifetime	<p>Enter a time period in seconds, for which the prefix is valid.</p> <p>The default value is <i>2592000</i> seconds.</p>
	<div style="border: 1px solid black; padding: 10px;"> <p> Note</p> <p>The value for the validity period should be lower than the value that is configured under Advanced IPv6 Settings for the Router Lifetime option.</p> </div>

The **Advanced Settings** menu contains the following fields relevant for IPv6:

Fields in the menu **Advanced IPv6 Settings**

Field	Description
Router Lifetime	<p>Only for IPv6 = Enabled, IPv6 Mode = Router (<i>Transmit Router Advertisement</i>) and Transmit Router Advertisement = Enabled</p>

Field	Description
	<p>Enter a time period in seconds. The router remains in the default router list throughout this interval.</p> <p>The default value is <i>600</i> seconds. The maximum value is <i>65520</i> seconds. A value of <i>0</i> means that the router is not a default router, and will not be entered in the default router list.</p> <div data-bbox="541 450 1319 638" style="border: 1px solid gray; padding: 5px;">  <p>Note</p> <p>The value for the Router Lifetime should be higher than the shortest link prefix validity period, which is configured under Basic IPv6 Parameters for the interface.</p> </div>
<p>Router Preference</p>	<p>Only for IPv6 = Enabled, IPv6 Mode = Router (<i>Transmit Router Advertisement</i>) and Transmit Router Advertisement = Enabled</p> <p>Select your router's preference for choice of default router. This is useful for cases where a node receives advertisements from multiple routers, or for back-up scenarios.</p> <p>Possible values:</p> <ul style="list-style-type: none"> • <i>High</i> • <i>Medium</i> (default value) • <i>Low</i>
<p>DHCP Mode</p>	<p>Only for IPv6 = Enabled, IPv6 Mode = Router (<i>Transmit Router Advertisement</i>) and Transmit Router Advertisement = Enabled</p> <p>Select the information forwarded to the DHCP client.</p> <div data-bbox="541 1359 1319 1513" style="border: 1px solid gray; padding: 5px;">  <p>Note</p> <p>To achieve this, your router must not be set up as a DHCP server.</p> </div> <p>By selecting <i>Other - DNS Servers, SIP Servers</i> (default value), no address-related information, such as i.e.,</p>

Field	Description
	<p>DNS, VoIP, etc., is passed through.</p> <p>Activate this option if the hosts in the network are to automatically set-up your IP address via SLAAC. In this case, the router only sends non-address-related data via DHCP.</p> <p>With the selection of <i>Managed - IPv6 Address Management</i> both the IPv6 address as well as all non-address-related data are derived from the host via DHCP.</p>
DNS Propagation	<p>Only for IPv6 Mode = <i>Router (Transmit Router Advertisement)</i> and Transmit Router Advertisement <i>Enabled</i></p> <p>Select whether DNS server addresses are to be propagated via router advertisements and if yes, in which manner. A maximum of two DNS server addresses are propagated.</p> <p>Possible values:</p> <ul style="list-style-type: none"> • <i>Off</i>: No name DNS server address is propagated. • <i>Self</i>: The personal IP address is propagated as the DNS server address. In case of several addresses, the addresses are propagated in the following order: <ul style="list-style-type: none"> • Global addresses • ULA (Unique Local Addresses) • Link-local addresses • <i>Other</i>: The statically configured and dynamically learned DNS server entries are propagated according to their priority. If no entries are available, no addresses are propagated.

2.2.2 IPv6 Route Configuration

A list of all configured routes are displayed in the **Network->Routes->IPv6 Route Configuration** menu.

2.2.2.1 Edit or New

Select the  icon to edit existing entries. Choose the **New** button to create additional routes.

Routes without an  icon have been created by the router automatically and cannot be

edited.

Route Parameters	
Description	<input type="text"/>
Route Active	<input checked="" type="checkbox"/> Enabled
Route Type	Network Route via Gateway ▾
Destination Interface	Select one ▾
Source Address / Length	<input type="text"/> /64
Destination Address / Length	<input type="text"/> /64
Gateway Address	<input type="text"/>
Metric	1 ▾

Fig. 4: Network->Routes->IPv6 Route Configuration->New

The **Network->Routes->IPv6 Route Configuration->New** menu consists of the following fields:

Fields in the menu Route Parameters

Field	Description
Description	Enter a description for the IPv6 route.
Route Active	Select if the route is to be active or inactive. With <i>Enabled</i> the status of the route will be set to active. The function is enabled by default.
Route Type	Select the type of route. Possible values: <ul style="list-style-type: none"> • <i>Default Route via Interface</i> : Route via a specific interface that is used if no other suitable routes are available. • <i>Default Route via Gateway</i>: Route via a specific gateway that is used if no other suitable routes are available. • <i>Host Route via Interface</i>: Route to an individual host via a specific interface. • <i>Host Route via Gateway</i>: Route to an individual host via a specific gateway.

Field	Description
	<ul style="list-style-type: none"> • <i>Network Route via Interface</i>: Route to a network via a specific interface. • <i>Network Route via Gateway</i> (default value): Route to a network via a specific gateway.
Destination Interface	<p>Select the IPv6 interface to be used for this route.</p> <p>You can select among the interfaces that are created under LAN->IP Configuration->Interfaces->New and for which the use of IPv6 is enabled.</p>
Source Address / Length	<p>Enter the IPv6 source address along with the corresponding prefix length.</p> <p>The entry <code>::</code> describes an unspecific address.</p> <p>By default the prefix length <code>64</code> is predefined.</p>
Destination Address / Length	<p>Enter the IPv6 target address along with the corresponding prefix length.</p> <p>The entry <code>::</code> describes an unspecific address.</p> <p>By default the prefix length <code>64</code> is predefined.</p>
Gateway Address	<p>Enter a the IPv6 address for the next hop.</p>
Metric	<p>Select the priority of the route.</p> <p>The lower the value, the higher the priority of the route.</p> <p>The valuation of <code>0</code> to <code>255</code>, the default value is <code>1</code>.</p>

2.2.3 IPv6 Routing Table

In the **Network->Routes->IPv6 Routing Table** menu a list of all IPv6 routes active in the system are displayed.

Fig. 5: Network->Routes->IPv6 Routing Table

Fields in the menu IPv6 Routing Table

Field	Description
Route	Displays the source and target address which is used for this route as well as the gateway IP address. In case of routes received via DHCP, nothing is displayed.
Interface	Displays the interface which is used for this route.
Metric	Displays the route priority. The lower the value, the higher the priority of the route
Protocol	Displays how the entry was generated, e.g., manual (<i>Local</i>) or via one of the available protocols.

2.2.4 General Prefix Configuration

A list of all configured IPv6 prefixes is displayed in the **Networking->IPv6 General Prefixes->General Prefix Configuration** menu.

2.2.4.1 Edit or New

Select the  icon to edit existing entries. Choose the **New** button to configure additional operations.

General Prefix Configuration

Basic Parameters	
General Prefix active	<input checked="" type="checkbox"/> Enabled
Name	<input type="text"/>
Type	<input checked="" type="radio"/> Dynamic <input type="radio"/> Static
From Interface	Select one ▼

The Firewall->Policies->IPv6 Filter Rules->New menu consists of the following fields:

Fields in the menu Basic Parameters

Field	Description
Source	<p>Select one of the preconfigured aliases for the source of the packet.</p> <p>In the list all WAN/LAN interfaces, interface groups (see Firewall->Interfaces->IPv6 Groups), addresses (see Firewall->Addresses->Address List) and address groups (see Firewall->Addresses->Groups) are available for selection for which the IPv6 is enabled.</p>
Destination	<p>Select one of the preconfigured aliases for the destination of the packet.</p> <p>In the list all WAN/LAN interfaces, interface groups (see Firewall->Interfaces->IPv6 Groups), addresses (see Firewall->Addresses->Address List) and address groups (see Firewall->Addresses->Groups) are available for selection for which the IPv6 is enabled.</p>
Service	<p>Select one of the preconfigured services to which the packet to be filtered must be assigned.</p> <p>The extensive range of services configured ex works includes the following:</p> <ul style="list-style-type: none"> • <i>ftp</i> • <i>telnet</i> • <i>smtp</i> • <i>dns</i>

Field	Description
	<ul style="list-style-type: none"> • <i>http</i> • <i>nntp</i> <p>Additional services are created in Firewall->Services->Service List.</p> <p>In addition, the service groups configured in Firewall->Services->Groups can be selected</p>
Action	<p>Select the action to be applied to a filtered packet.</p> <p>Possible values:</p> <ul style="list-style-type: none"> • <i>Access</i> (default value): The packets are forwarded on the basis of the entries. • <i>Deny</i> : The packets are rejected. • <i>Reject</i> : The packets are rejected. An error message is issued to the sender of the packet.

2.2.10 IPv6 Groups

A list of all configured IPv6 interface routes is displayed in the **Firewall->Interfaces->IPv6 Groups** menu.

You can group together the interfaces of your device. This makes it easier to configure firewall rules.

2.2.10.1 New

Choose the **New** button to set up new IPv6 interface groups.

Fig. 14: **Firewall->Interfaces->IPv6 Groups->New**

The **Firewall->Interfaces->IPv6 Groups->New** menu consists of the following fields:

Fields in the menu **Basic Parameters**

Field	Description
Description	Enter the desired description of the IPv6 interface group.
Members	Select the members of the group from the available interfaces. To do this, activate the field in the Selection column.

2.2.11 Address List

A list of all configured addresses is displayed in the **Firewall->Addresses->Address List** menu.

2.2.11.1 New

Choose the **New** button to create additional addresses.

Address List Groups

Basic Parameters	
Description	<input type="text"/>
IPv4	<input checked="" type="checkbox"/> Enabled
Address Type	<input checked="" type="radio"/> Address / Subnet <input type="radio"/> Address Range
Address / Subnet	<input type="text"/> / <input type="text" value="255.255.255.0"/>
IPv6	<input type="checkbox"/> Enabled

OK Cancel

Fig. 15: **Firewall->Addresses->Address List->New**

The **Firewall->Addresses->Address List->New** menu consists of the following fields:

Relevant fields in the menu **Basic Parameters**

Field	Description
IPv6	Allows configuration of IPv6 address lists. The function is enabled with <i>Enabled</i> . The function is disabled by default.
Address / Prefix	Only for IPv6 = <i>Enabled</i> Enter IPv6 address and the related prefix.

2.2.12 Groups

A list of all configured address groups is displayed in the **Firewall->Addresses->Groups** menu.

You can group together addresses. This makes it easier to configure firewall rules.

2.2.12.1 New

Choose the **New** button to set up additional address groups.

The screenshot shows a dialog box titled 'New' with two tabs: 'Address List' and 'Groups'. The 'Address List' tab is active. Below the tabs is a 'Basic Parameters' section with the following fields:

- Description:** A text input field.
- IP Version:** Radio buttons for 'IPv4' (selected) and 'IPv6'.
- Selection:** A table with two columns: 'Addresses' and 'Selection'. The 'Addresses' column contains the text 'ANY'. The 'Selection' column contains a checkbox.

At the bottom of the dialog are two buttons: 'OK' and 'Cancel'.

Fig. 16: Firewall->Addresses->Groups->New

The **Firewall->Addresses->Groups->New** menu consists of the following fields:

Relevant field in the menu Basic Parameters

Field	Description
IP Version	<p>Select the IP version used.</p> <p>Possible values:</p> <ul style="list-style-type: none"> • <i>IPv4</i> • <i>IPv6</i> <p><i>IPv4</i> is selected by default.</p>

2.2.13 DNS Servers

A list of all configured DNS servers is displayed in the **Local Services->DNS->DNS Servers** menu.

2.2.13.1 Edit or New

Select the  icon to edit existing entries. Select the **New** button to set up additional DNS servers.

Here you can configure both global DNS servers and DNS servers that are to be assigned to a particular interface.

Configuring a DNS server for a particular interface can be useful, for example, if accounts with different providers have been set up via different interfaces and load balancing is being used.

Basic Parameters	
Admin Status	<input checked="" type="checkbox"/> Enabled
Description	<input type="text"/>
Priority	6
Interface Mode	<input type="radio"/> Static <input checked="" type="radio"/> Dynamic
Interface	None
IP Version	<input checked="" type="radio"/> IPv4 <input type="radio"/> IPv6

Fig. 17: Local Services->DNS->DNS Servers->New

The **Local Services->DNS->DNS Servers->New** menu consists of the following fields:

Relevant fields in the menu Basic Parameters

Field	Description
IP Version	<p>Select the IP version used.</p> <p>Possible values:</p> <ul style="list-style-type: none"> IPv4 IPv6 <p>IPv4 is selected by default.</p>
Primary IPv6 DNS Server	<p>Only if Interface Mode = <i>Static</i></p> <p>Enter the IPv6 address of the first name server for Internet address name resolution.</p>

Field	Description
Secondary IPv6 DNS Server	Only if Interface Mode = <i>Static</i> Optionally, enter the IPv6 address of an alternative name server.

2.2.14 DHCPv6-Server

Alternatively, you can use your device as a DHCPv6 server. This DHCPv6 server can distribute IP addresses and DHCP options to clients or just DHCP options without addresses. These parameters are summarised in a so-called "Option Set". An option set can be linked to an interface (see under **Local Services->DHCPv6 server->DHCPv6 server->New**) or it can be globally configured (see under **Local Services->DHCPv6 server->DHCPv6 server global options->New**). DHCP options can, for example, contain information on DNS servers or time servers.

Note

An IPv6 address pool occurs by allocating an IPv6 link prefix (subnet with the length / 64) to a DHCPv6 option set. The definition of a separate section of IPv6 addresses, e.g., fc00:1:2:3::1.fc00:1:2:3::100, unlike in DHCPv6, is not provided.

For the configuration of an IPv6 address pools, the following system requirements must be met:

- (a) IPv6 must be enabled on the relevant interface.
- (b) An IPv6 link prefix (subnet) with the length /64 must be configured on the desired interface. An IPv6 link prefix can be defined on two types:
 - The IPv6 link prefix is derived from a general IPv6 prefix (prefix with a length of, for example /56 or /48). In this case, the general IPv6 prefix must be configured in the **Networking->General IPv6 prefixes->General Prefix Configuration** menu.
 - The IPv6 link prefix with the length /64 is manually configured on the corresponding interface and not derived from a general IPv6 prefix.
- (c) The **DHCP Server** option must be enabled for the interface.

Furthermore, the following settings are recommended:

- The values for the **Preferred Lifetime** and **Valid Lifetime** options should be set to values that are bigger than the value for **Router Lifetime**.

In the case of a **Router Lifetime** of 600 seconds, e.g., a **Preferred Lifetime** of 900 seconds and a **Valid Lifetime** of 1800 are recommended.

- The **DHCP Mode** option is to be enabled.

To set the aforementioned options, select the **LAN->IP configuration->Interfaces** menu. Using the  symbol, select the desired interface. Enable IPv6 and set **IPv6 Mode** to *Router (Transmit Router Advertisement)*. In the **IPv6 Addresses** field click on **Add** and configure the link prefix. Press **Apply** to confirm your configuration. The configuration of the recommended settings then takes place in the following menus:

- **Router Lifetime: LAN->IP configuration->Interfaces->New->Advanced Settings->Advanced IPv6 Settings**
- **Preferred Lifetime and Valid Lifetime: LAN->IP configuration->Interfaces->New->Basic IPv6 Parameters->Add->Advanced**

Here - with regard to an interface - you can create address pools in an option set and define DHCP options.

2.2.14.1 Edit or New

Select the **New** button to create a option set. Select the  icon to edit existing entries.

DHCPv6 Server		DHCPv6 Global Options	Stateful Clients	Stateful Clients Configuration
Basic Parameters				
Name	<input type="text"/>			
Interface	Select one ▾			
Address assignment	Link Prefix	<input type="text"/>		
	<input type="button" value="Add"/>			
Server Options				
DNS domains search list	<input type="button" value="Add"/>			
Advanced Settings:				
Advanced Server Options				
DNS Server	Use RA or Global Fallback DNS Server <input checked="" type="checkbox"/> Enabled			
SNTP Server	<input type="button" value="Add"/>			
<input type="button" value="OK"/>		<input type="button" value="Cancel"/>		

Fig. 18: **Local Services->DHCPv6 Server->DHCPv6 Server->New**

The menu **New** consists of the following fields:

Fields in the menu **Basic Parameters**

Field	Description
Name	Enter a name for the option set.
Interface	<p>Select the IPv6 interface to which the option set should be linked.</p> <p>Interfaces with the following configuration are available for selection:</p> <ul style="list-style-type: none"> • IPv6 is activated. • The DHCP Server option is enabled. <p>In the ex works state, IPv6 is deactivated for all interfaces. If the desired interface is not available for selection, you can configure it in the LAN->IP Configuration->Interfaces menu according to the instructions of the mentioned policies.</p>
Address assignment	<p>The definition of an IPv6 address pool occurs through the allocation of an IPv6 link prefix (subnet with the length /64) to a DHCPv6 option set. The IPv6 address pool always includes the complete 64 bit address range of the selected IPv6 link prefix. The address assignment takes place randomly.</p> <p>With Add you can assign one or several IPv6 link prefixes to the IPv6 option set.</p>
	<p> Note</p> <p>Please note that the only IPv6 link prefixes that are assigned to selected interfaces are available for selection.</p>

Fields in the menu **Server options**

Field	Description
DNS domains search list	Using Add you can create a list of domain names which are to be used on the client page as domain search lists for name resolution (DHCPv6 option 24 "Domain Search List"). The domain names are transmitted to clients according to the sequence specified by the lists.

The **Advanced Settings** menu consists of the following fields:

Fields in the **Advanced Server Options** menu

Field	Description
DNS Server	<p>Here, you can configure the DNS servers that are to be propagated via DHCPv6 (DHCPv6 option 23 "DNS Recursive Name Server").</p> <p>In the default setting, the global DNS servers of the system are propagated. (The global DNS servers are configured in the DNS Propagation field in the LAN->IP Configuration->Interfaces-> ->Advanced Settings menu with IPv6 = Enabled.)</p> <p>However, DNS servers can be manually specified and transmitted to clients. To do so, deactivate the Use RA or Global Fallback DNS Server option and using Add create the desired DNS server entries.</p>
SNTP server	<p>Here, you can configure the time servers that are to be propagated via DHCPv6 (DHCPv6 option 31 "Simple Network Time Protocol Server"). Using Add you can create the desired time server entries.</p>

2.2.15 DHCPv6 Global Options

In this menu, you can configure the globally valid DHCPv6 options for the DHCPv6 server. An option configured here is always propagated if there is no exact definition (e.g., not interface-specific or vendor ID-specific definition) for this option.

Fig. 19: Local Services->DHCPv6 Server->DHCPv6 Global Options

The menu **New** consists of the following fields:

Fields in the menu Basic Parameters

Field	Description
DNS domains search list	Using Add you can create a list of domain names which are to be used on the client page as domain search lists for name resolution (DHCPv6 option 24 "Domain Search List"). The domain names are transmitted to clients according to the sequence specified by the lists. The domain name (e.g., dev.bintec.de) must end with a dot (.).

The **Advanced Settings** menu consists of the following fields:

Fields in the menu Server preference

Field	Description
Server preference	<p>The DHCPv6 option 7 preference may be included in the DHCPv6 advertisement sent to the clients from the DHCPv6 servers.</p> <p>Possible values are <code>0 . . . 255</code>. In a network with several DHCPv6 servers, this option controls which DHCPv6 servers have the highest priority in the network. If a client receives DHCPv6 advertisements with different priorities from different servers, the client usually takes over the values of the server with the highest priority. However, the client can accept DHCPv6 advertisement with a lower priority, if the parameter set included in the DHCPv6 advertisement corresponds to more of the options requested by the client.</p> <p>The <code>0</code> value means "not specified" (lowest priority), <code>255</code> means the highest priority.</p>

Fields in the menu Advanced Server Options

Field	Description
DNS Server	<p>Here, you can configure the DNS servers that are to be propagated via DHCPv6 (DHCPv6 option 23 "DNS Recursive Name Server").</p> <p>In the default setting, the global DNS servers of the system are propagated. (The global DNS servers are configured in the DNS Propagation field in the LAN->IP Configuration->Interfaces-> ->Advanced Settings menu with IPv6 = Enabled.)</p>

Field	Description
	However, DNS servers can be manually specified and transmitted to clients. To do so, deactivate the Use RA or Global Fall-back DNS Server option and using Add create the desired DNS server entries.
SNTP server	Here, you can configure the time servers that are to be propagated via DHCPv6 (DHCPv6 option 31 "Simple Network Time Protocol Server"). Using Add you can create the desired time server entries.

2.2.16 Stateful Clients

Here you will find information on stateful clients as soon as these have obtained an IPv6 address.

Fig. 20: Local Services->DHCPv6 Server->Stateful Clients

2.2.17 Stateful Clients Configuration

In a stateful configuration of IPv6 clients, the client will be transmitted the IPv6 prefix in addition to the DHCP options.

2.2.17.1 Edit or New

select the **New** button to create stateful clients. Usually you do not need to create any entries. Choose the  icon to edit existing entries. You should open each automatically created entry to check the content and adapt it if necessary.

[DHCPv6 Server](#) | [DHCPv6 Global Options](#) | [Stateful Clients](#) | **Stateful Clients Configuration**

Basic Parameters	
DUID	<input type="text"/>
Accept Client FQDN	<input type="checkbox"/> Enabled
Administrative FQDNs	<input type="button" value="Add"/>
Static Interface Identifier	<input type="text"/> /64

Fig. 21: Local Services->DHCPv6 Server->Stateful Clients Configuration+New

The menu consists of the following fields:

Fields in the menu Basic Parameters

Field	Description
DUID	<p>A client uses the DUID (DHCP unique identifier) field to identify themselves and to obtain an IP address from DHCPv6 servers.</p> <p>If you create an entry with the New button, you can enter the DUID as a 16- to 20- digit HEX number. You can enter it with the minus separator as in Windows or as a block without a separator as in Linux.</p>
Accept Client FQDN	<p>If Accept Client FQDN is enabled, the client will enter the domain name server with the parameter FQDN (Fully Qualified Domain Name) in the cache.</p>
Administrative FQDNs	<p>Even in automatically created entries, you can enter the parameter FQDN (Fully Qualified Domain Name) using Add.</p>
Static Interface Identifier	<p>The Static Interface Identifier field is the host share of the IPv6 address, i.e., the last 64 bit of the IPv6 address. This prefix must start with ::.</p>

2.2.18 Ping Test

Fig. 22: Maintenance->Diagnostics->Ping Test

You can use the ping test to check whether a certain host in the LAN or an internet address can be reached.

Relevant fields in the menu Ping Test

Field	Description
Test Ping Mode	Select the IP version to be used for the ping test. Possible values: <ul style="list-style-type: none"> • <i>IPv4</i> • <i>IPv6</i>
Use Interface	Only for Test Ping Mode = <i>IPv6</i> For link local addresses select the interface to be used for the ping test. <i>Default</i> can be used for global addresses.

Pressing the **Go** button starts the ping test. The **Output** field displays the ping test messages.

2.2.19 Traceroute Test

Fig. 23: **Maintenance->Diagnostics->Traceroute Test**

You use the Traceroute test to display the route to a particular address (IP address or domain name), if this can be reached.

Relevant field in the menu Traceroute Test

Field	Description
Traceroute Mode	Select the IP version to be used for the Traceroute test. Possible values: <ul style="list-style-type: none"> • IPv4 • IPv6

Pressing the **Go** button starts the Traceroute test. The **Output** field displays the traceroute test messages.

2.3 IPSec - New algorithms

From **Systemsoftware 10.1** onwards, there are new algorithms available for IPSec. In the **VPN->IPSec->Phase-1 Profiles->Create new IKEv1 profile or Create new IKEv2 profile->New** or **VPN->IPSec->Phase-2 Profiles->New** menu, the new hash algorithms *SHA2-256*, *SHA2-384* and *SHA2-512* are available under **Proposals**. They can be selected in the GUI under the designation **Authentication**.

SHA2 is the successor of SHA1. The number that follows "SHA2" states the respective length of the hash value. In contrast to SHA1, the hash algorithm SHA2 is currently reliable.

In the **VPN->IPSec->Phase-1 Profiles->Create new IKEv2 profile->New** the new Diffie-Hellman groups *14 (2048 Bit)*, *15 (3072 Bit)* and *16 (4096 Bit)* are available under **Proposals**.

The Diffie-Hellman groups determine the strength of the key. Larger group numbers mean more security but require a greater computing effort for the calculation of the key.

Note

Please observe the following information on this expansion:

The new algorithms - particularly those for the generation of long keys for the Diffie-Hellman exchange - require significant computing effort. The following device will support these new algorithms:

- bintec RS3xx- and RS123x series
- be.IP series
- bintec RXL series.

Depending on the number of active IPSec tunnels, a partially significant influence on the device's performance must be expected in all devices. In a later release, the bintec RXL series will have hardware support of the algorithms added which will lead to a significant increase in performance compared to the merely software-based solutions.

The devices of Rxx02- and RTxx02 series do NOT support the new algorithms due to their older hardware equipment.

2.4 IKEv2 Routing

From **Systemsoftware 10.1.3** onwards, the so-called "IKEv2 routing" will be available for the set-up of a tunnel with a Cisco FlexVPN server as a remote terminal. You bintec router as a client communicates its networks to the FlexVPN server which enters it into its routing table.

2.5 Maintenance - new options (hybrid)

From **Systemsoftware 10.1.3** onwards, the new *Import Additional Files (to usb storage)* and *Format MMC/SD Card* options will be available in the **Maintenance->Software & Configuration->Options** menu in the **Action** field for all devices of the hybrid series which contain an inserted SD card.

2.6 SIA

From **Systemsoftware 10.1.3** onwards, in the **External Reporting->SIE->SIA** menu, a file can be created that delivers support with comprehensive information on the status of the device, e.g., the current configuration, available storage, running time of the device etc.

2.7 Factory reset

From **Systemsoftware 10.1.3** onwards, you can reset your device via the GUI in the **Maintenance->Factory Reset** menu in the ex works state.

2.8 Display manufacturer via MAC address

From **Systemsoftware 10.1.3** onwards, you can switch the display of the manufacturer in the MAC address on or off in the **System Management->Global Settings->System** menu. Up to eight characters are used at the beginning of the MAC address for the manufacturer name (usually an abbreviation thereof). Instead of `00:a0:f9:37:12:c9` the manufacturer display will display, for example, `BintecCo_37:12:c9`.

2.9 New DNS menu

2.9.1 Dynamic Hosts

In the **Local Services->DNS->Dynamic Hosts** you can see the relevant information on the dynamic DNS entries.

Fig. 24: Local Services->DNS->Dynamic Hosts

2.10 Log out Users

It may happen that the functions of the configuration interface are impaired due to an incompletely set-up configuration session. In this case, all existing connections for the GUI can be viewed and ended in this menu, if necessary.

2.10.1 Log out Users

This menu first shows a list of all the active configuration connections.

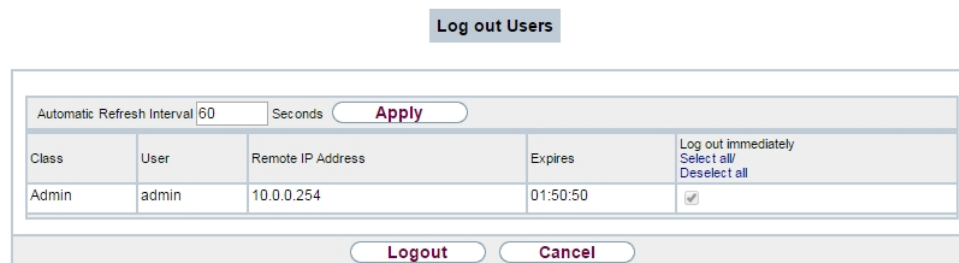

Fig. 25: Maintenance->Log out Users->Log out Users

Fields in the menu Log out Users

Field	Description
Class	Displays the user class that the registered user belongs to.
User	Displays the user name.
Remote IP Address	Displays the IP address from which the connection was set-up. This can be the address of a PC but also the address of an intermediately stored router.
Expires	Displays when the connection will be automatically disconnected.
Log out immediately	If you activate the control boxes, the user will be logged out of

Field	Description
	the system Logout with one click.

2.10.1.1 Logout Options

Once you have confirmed the selection of ending the connect with logging off, you can select whether and which configurations that are linked to the session in questions, are saved prior to logging of the user.

Fig. 26: Maintenance->Log out Users->Logout

2.11 Automatic VDSL/ADSL mode

In the **WAN->Internet + Dialup->PPPoE->New** menu in the **PPPoE Ethernet Interface** field, the *Automatic* value is available to support the automatic VDSL/ADLS mode which was already available in the assistants. In this mode, the interface for internet access is selected automatically. Please note that an interface must be created for an ADLS access in the ATM menu; this is not necessary for a VDSL access.

2.12 Firewall - Reset

From **Systemsoftware 10.1.3** onwards, you can reset the firewall on your ex works setting in the **Firewall->Policies->Options** menu.

2.13 Emergency calls

From **Systemsoftware 10.1.3** onwards, the emergency call will be prioritised. If all available channels (even SIP channels are considered) are busy, a current call will be ended to be able to send the emergency call.

2.14 elmeg IP680 available

The IP telephone **elmeg IP680** is available from **Systemsoftware 10.1.3** onwards. It is automatically recognised by the elmeg hybrid systems and displayed as a terminal under **Terminal->elmeg system phones->elmeg IP**.

2.15 Telephones in teams

If teams are used, from **Systemsoftware 10.1.3** onwards, the *On No Reply* and *On Busy* functions can be used because inactive telephones are automatically logged out of the teams.

Chapter 3 Changes

The following changes have been made in **Systemsoftware 10.1.3** .

Note

Please note that a change for different devices may be available at time different times.

3.1 Password change when you first log on.

From **Systemsoftware 10.1.3** onwards, the page to change the password will be opened as long as the Admin password has not been changed and the login page is not displayed as before. The administrator now no longer has to be logged in to change his/her password.

3.2 PBX assistant upgraded

In the **Assistants->PBS** menu, the PBS-assistant was expanded by the tabs **First Steps**, **Terminals** and **Call Distribution**.

3.3 Designation adjusted

Due to the introduction of IPv6, a few designations under IPv4 were adjusted for improved distinctness, e.g., in the **Firewall->Policies->Options** menu, the field **Firewall Status** was renamed **Status of the IPv4 Firewall**.

3.4 Menu description changed

The menu description **Terminals->elmeg System Phones->elmeg IP1x** was changed in **Terminals->elmeg System Phones->elmeg IP**.

3.5 Domain forwarding changed

In the **Local Services->DNS->Domain Forwarding->New** menu, the entry possibilities were expanded with **Forwarding = Domains** in the **Domains** field.

Until now, for example, **Domains** could be entered as `*.qa.bintec.de` in order to use `*.qa.bintec.de`.

From **Systemsoftware 10.1.3** onwards, a leading wild card is automatically entered during input without the `*` leading wild card and after confirming with **OK**. For example, you can enter `.qa.bintec.de` or `qa.bintec.de` and use `*.qa.bintec.de` after automatically confirming with **OK**.

3.6 VDSL - TCP Upstream Performance improved

In VDSL-connections, the TCP Upstream Performance was significantly improved by reducing the packet loss and it now moves in the same area as comparable devices of other manufacturers.

3.7 LEDs for bintec RS353jv-4G changed

From **Systemsoftware 10.1.3** onwards, the LEDs `LTE` and `USB` in the **bintec RS353jv-4G** device show the following behaviour:

LED status display

LED	Colour	Status	Information
LTE	green	flashing in a 1-second interval	Mobile connection is initialised
	green	on	WAV-connection established.
	green	flashing in overhaul interval	Data traffic via 3G/4G
	green	flashing in a 3-second interval	An error has occurred
		off	So SIM card in device
USB	green	on	USB/LTE stick installed
	green	flashing	Data traffic via USB
		off	No USB connection.

Wireless standard

Via the **biboadmledmeter** MIB-variable, you can activate an additional LED mode, which

enables you to determine the state of the mobile connection. With **biboadmledmeter= 1** you activate the mode, with **biboadmledmeter= 2** you deactivate it. If you do not want to save the state of the LED mode, you can also activate it by pressing the reset-button three times in a row for approx. 1 second. By briefly pressing the button once more, the mode is deactivated again.

The following link exists between the lights of an LED and the wireless standard in use:

LED	Wireless standard
BRI	GSM
USB	UMTS
LTE	LTE

Furthermore, you can read the signal quality from the eight Ethernet LEDs. If all eight LEDs are on, this presents an almost perfect connection. If the signal quality is low, fewer LEDs will be illuminated.

3.8 SIP connections improved

SIP interruptions are recognised quicker and rectified

Chapter 4 Troubleshooting

The following bugs have been fixed in **Systemsoftware 10.1.3** :

Note

Please note that a troubleshooting for different devices may be available at time different times.

4.1 Stacktrace:

ID 19229

If an Ethernet interface, e.g., *en1-0* and a WLAN interface, e.g., *vss7-10* were assigned to the same bridge group *br0* a sporadic stacktrace would occur.

4.2 Panic (hybird 600)

ID 19574

It can happen that a *hybird 600* parameter> restarts every day. In a few of the connected phones, there were problems with the call connection.

4.3 Assistants - Internet assistant incorrect

ID 19394

If the Internet assistant was used, the **connection type** = *UMTS/LTE* was set and **Always active** was *activated* the assistant created two default routes.

4.4 Internet assistant - Incorrect parameter

ID n/a

Under specific conditions, *t-online-com/* was added in the Internet assistant by mistake by the system with a correctly entered user name.

4.5 Problems with Telekom Speedstick LTE V

ID 19147

The Telekom Speedstick LTE V (Huawei E3372) does not work correctly.

4.6 Internet connection down

ID n/a

If an interface was clicked, it may happen that an Internet connection was capped that was already set-up.

4.7 The same icon for different actions

ID n/a

The same  symbol was used start and reset the actions by mistake. From **Systemsoftware 10.1.3** onwards, the  symbol is available to reset the actions. For example, you can reset the profiles in ex works state under **System administration->Configuration access->Access profile**.

4.8 Error message incorrect

ID 19420

When entering the **country code** it may happen that an incorrect error message was displayed.

4.9 Entries cannot be deleted

ID 19638

It was not possible to delete entries in the **Physical Interfaces->ISDN Ports->MSN Configuration** menu using the  symbol.

4.10 Unintentional separation of a connection (hybird)

ID 19334

It can happen that a connection selected by elmeg was disconnected after external transfer.

4.11 Firmware update failed

ID 19327

A firmware update was not possible without an IPv6 connection.

4.12 LTE - Echo request packets did not reach their destination

ID 19333

Echo request packets that were generated on a router with in integrated LTE(4G) modem using Keepalive Monitoring did not reach the target host.

4.13 Roaming problems

ID n/a

In M2M cards problems with data roaming may occur.

4.14 SSH - Connection failed

ID 19213

After a proper router operation of approximately 2 days, the SSH connection suddenly failed.

4.15 Wrong page

ID 19506

It can happen that a wrong page is loaded after logging in.

4.16 Configuration session incomplete

ID 19493

It can happen that a configuration session could not be ended and TR069 could not be configured if the user just closed the browser - instead of logging off.

4.17 Windows 10 Edge Browser - Unwanted line breaks

ID n/a

The unwanted line breaks in the output of the browser window edge (Spartan) was removed by a Microsoft fix. The internal fix was removed because it was no longer required.

4.18 Connection failures (hybird)

ID 19334

Under specific circumstances it could result in connection failures.

4.19 SSL - No transmission of configuration files.

ID 19219

No configuration files could be transmitted via a SSL connection.

4.20 FAX not working correctly

ID 19098

When attempting to send a fax, it can happen that a system blockage occurs and the router no longer terminated the connection.

4.21 VoIP - No voice transmission

ID 19184

If a team of an analogue or a ISDN telephone was used, although an incoming call was signalled correctly, there was no voice transmission when the call was received.

4.22 VoIP - Account not usable

ID 19551

When using VoIP clients (e.g. a smart phone with VoIP client or a VoIP telephone) the VoIP account was not usable due to a NAT conflict.

4.23 VoIP - Provider problems

ID n/a

It can happen that providers with specific profiles are not displayed and/or cannot be edited or deleted.

4.24 WLAN Controller - WTP does not work correctly

ID 19553

If several WTPs are managed by one WLAN controller, after switching a WTP on and off it can happen that another WTP is in the wrong state.

4.25 WLAN controller - Stacktrace

19698

If slave access points were managed by one wireless LAN controller, it can happen that a stacktrace occurred in a few access points.

4.26 Network - Reboots

ID 19484

When using a drop-in group, it resulted in two or three reboots per day.

4.27 QoS - no classification of high priority packets

ID 19527

The internal classification of the high priority packets was interrupted by an active firewall.

4.28 QoS - Configuration incorrect

19366

When using the **First steps** assistants, the QoS configuration was incorrect.

4.29 QoS - 1TR112 requirements not met

ID 19296

The QoS signalisation did not correspond to the 1TR112 requirements.

4.30 Codec problems

ID 19471

If the codec, which was named "Clearmode" according to RFC4040, was up for selection with other codecs, no data could be transmitted.

4.31 Codec problems (hybird 600)

ID 19606

There were problems in the negotiation of the codec between a polycom sound station IP 6000 and a **hybird 600**.

4.32 SIP - connection terminated

19587

It can happen that a connection was terminated after call forwarding.

4.33 SIP - Calls rejected

ID 19486

It can happen that incoming calls were rejected with the 480 status message (Temporarily not available). In doing so, the system issued the debug message "No matching codecs, call rejected".

4.34 SIP - Incoming calls ignored

ID 19432

It can happen that incoming SIP calls were ignored.

4.35 SIP - Incorrect format

ID 19447

Under specific condition, it can happen that an incorrect number format was used.

4.36 Telephony - Calls not possible

ID 19373

It can happen that no calls were possible from the main MSN.

4.37 Telephony - Incorrect connection data

ID 19422

Incorrect connection data was displayed during longer telephone calls.

4.38 Telephony - Provisioning problems

19449

When provisioning individual telephone, it can happen that the provisioning process only worked once and no updates were possible.

4.39 Telephony - Voice connections incorrect (hybird)

ID 19002

It can happen that voice connections were only usable to one side.

4.40 PBS - registration process delayed

ID 19417

Under specific condition, it can happen that numbers are registered with a great deal of delay in a telephone system.

4.41 DISA problem (hybird)

17964

The selection via DISA does not work with SIP connections and DTMF inband.

4.42 Network - Full cone NAT

ID n/a

If the **NAT method** = *full-cone* setting was using the **Network->NAT->NAT Configuration->New** menu, certain problems must have occurred and the NAT session was terminated.

4.43 PPP - No dialin

ID 19156

The PPP dialin via GPRS/GSM does not work.

4.44 ISDN - Call terminated

ID 19080

A short deactivation of ISDN results in a termination of the call.

4.45 IPSec - No data traffic

ID 19538

It can happen that no data was transmitted via IPSec as soon as the underlying PPPoE connection was briefly interrupted.

4.46 SIF - Alias problems

19502

Under specific circumstances the interface alias for the *ANY* interface does not exist for either IPv4 nor IPv6. The interface alias for the *LAN_Local* interface does not exist for IPv4.

4.47 DNS not working

ID 19363

The DNS service is not working because the port was preallocated with an incorrect value when configuring the SIP provider.

4.48 HTTPS - Certificate selection possible by mistake

ID 19511

Although the device family **hybird 300/600** does not support certificates, it was possible to configure certificates in the **System Management->Certificates** menu and these certificates can be selected in the **Local Services->HTTPS** menu.

4.49 DynDNS-Client - Input option incorrect

ID 19464

In the **Local Services->DynDNS Client->DynDNS Provider->New** menu, the **Update Path** field must not be left empty although it is not useful for each configuration.

4.50 Local services - Scheduling incorrect

ID 18745

If the **Schedule Interval** was set to *0*, configured scheduling actions were carried out by mistake.

4.51 Incorrect alert message

ID 18979

A syslog-message which occurs in each hotspot user-authentication ("HACC: Got IPC-reply: ..."), was displayed as an alert message although it had to do with an incorrect condition.

4.52 Hotspot-Gateway - Storage problem

ID 19274

When using the hotspot gateway together with RADIUS it can happen that a memory overflow occurs.

4.53 Hotspot gateway - Timeout cannot be switched off

ID 19290

In the **Local Services->Hotspot Gateway->Hotspot Gateway->New->Advanced Settings** menu it was not possible to enter the `0` value in the **Standard timeout during inactivity** field although this value is permitted to switch off the function.

4.54 External reporting - alert service not working correctly

ID 19291

The **Alert Service** in the **External Reporting** menu does not work correct with the `mail.selfhost.de` provider.

4.55 Monitoring - Keepalive Monitoring incorrect

ID 19313

Keepalive Monitoring does not work if the number of the **Successful Attempts** was greater than the number of **Failed Attempts** in the **Local Services->Monitoring->Hosts->New** menu.

4.56 MIB-Table ipsecPeerTable not changable

ID 19222

In the GUI in the **SNMP Browser** view, it was not possible to change the entries in the MIB table **ipsecPeerTable**.
